Complete Project Report

Project audit, SEO documentation and production readiness

Website: https://girzock.com
Audited build: http://localhost/girzock-website/
Technology: PHP 8.2, CodeIgniter 3.1.13, MariaDB
Audit date: 7 November 2026

Production readiness: NOT READY

Results describe the local build only. Nothing was verified on the production server except its redirects and sitemap response.

Executive Summary

> **Production readiness: READY TO DEPLOY, NOT YET LIVE.** The build passed its final local test run (9,372 checks passed, 11 failed, all one Firefox measurement method; 0 functional failures). It becomes production-ready only after the deployment steps in section 16 are done on the live server: production settings, HTTPS, the live database import and a smoke test. Nothing has been deployed, and deployment waits for your approval.

What the website does. It is the public website of GIRZOCK Technologies, a software company in Thisaiyanvilai, Tirunelveli, with an admin panel for its content. Visitors read about services, products, sample projects and articles, then send enquiries or job applications.

Item	Verified result	Status
Public pages	89 URLs crawled, all HTTP 200; 62 indexable; 61 in the sitemap. Legal pages added	PASS
Page templates	18 public page templates, of which 6 are detail templates	PASS
Admin modules	14 in the sidebar; 16 controllers including sign-in and profile	PASS
Content management	Almost all content is in MySQL and edited in the admin panel; homepage and About layout text is in the view files	PARTIAL
SEO system	Internal SEO checklist score 89/100 (weighted). Not a Google score; see section 9.3	PASS
Forms	Reply in 46 ms (median, final run; 43 to 60 ms in earlier runs) instead of 6,123 ms when email is slow; short toast only after the database save	PASS
Promotional popup	Admin chooses when it may reappear (default 7 days after closing, 30 after sending), with a reset	PASS
New blog workflow	Draft, preview, schedule and publish tested on the isolated copy; search engine submission is manual	PARTIAL
Technical condition	Final run: 9,372 checks passed, 11 failed, all one Firefox measurement method; 0 functional failures	PASS
Mobile performance	Lighthouse 50 to 59 on 11 pages; LCP 15.61 to 17.71 s, measured locally without compression	PARTIAL
Production deployment	Not performed; the live site at girzock.com does not run this build	FAIL

What must happen before launch

1. **Legal review.** Privacy, Terms and Cookie pages now exist and are linked in every footer. Have them reviewed before launch. Status: PARTIAL.
2. **Production settings are not applied.** `APP_ENV=development`, `COOKIE_SECURE=0`, local `BASE_URL`, empty `PUBLIC_URL`, and the HTTPS rules in `.htaccess` are commented out. Status: FAIL (expected until deployment).
3. **Email on the live server.** The SMTP sign-in was verified (no message sent), and both emails for your own two popup enquiries were logged as sent. Repeat one enquiry on the live server. Status: PARTIAL.
4. **The six job openings need confirming.** They publish `JobPosting` data with no closing date. Disable any that are not genuine vacancies. Status: NOT TESTED.
5. **Mobile speed.** The video now loads only when it comes into view, and the fonts are self-hosted. Lighthouse mobile is 50 to 59 locally, where compression is off. Re-measure on the live server with compression on. Status: PARTIAL.
6. **Live deployment has not happened.** `https://girzock.com/robots.txt` returns 404, so the live server is not running this build. Status: FAIL.

Statuses used in this report: PASS (verified and working), PARTIAL (implemented but incomplete or partly tested), FAIL (verified issue), NOT TESTED (no verification performed), NOT IMPLEMENTED (does not exist).

Latest Changes: 7 November 2026

Area	What changed	Measured result
Form speed	The server saves the enquiry, replies at once, then sends the two emails. Email results are logged per recipient and can be resent from the admin	6,123 ms before, 46 ms (median, final run; 43 to 60 ms in earlier runs) after, with a mail server that takes 3 s per email. Apache replied in about 4 ms with a 5 s task after the reply
Success message	"Thank you! Your enquiry has been submitted successfully." No reference number. Closes after 3.5 s, with a close button. Same on every form	Shown only after the server confirms the save; tested on all forms in three browsers
Popup reappearance	After N days (default 7), never after close, once per session, or every page load. Hidden for 30 days after sending the form. Reset button. Off always wins	All rules tested in Chromium, Firefox and WebKit
Popup form	Message optional, fixed 96 px box with no resizing, shorter company placeholder, more space above the button	No scrollbar at 1024×768 to 1920×1080
Social links	LinkedIn, Facebook, Instagram and WhatsApp URL fields in Website Settings, checked for https and the platform domain. An icon shows only with a valid saved address. All four are now live, with your LinkedIn and Facebook addresses. New tab, `noopener noreferrer`, labels	990 real-site, 90 admin and 307 appearance checks in three browsers, desktop, tablet and phone
Popup scrollbar	The closed service list took up space and made the form scroll by 44 to 102 px. It is now removed from the layout until opened	No scroll at 1024×768 to 1920×1080, in three browsers
Footer	The homepage footer and the tagline "Technology. Growth. Elevate." on every page	Checked on 23 page types
SEO	Scorecard across 10 categories; legal page descriptions lengthened; tag pages titled "Posts Tagged …"	Combined 89/100, overall 90.2/100 (internal checklist)
Content	6 short posts rewritten (446 to 668 words); a local paragraph for each of the 16 services; Sattankulam and district towns on Areas We Serve	See the content audit in `docs/CONTENT_QUALITY_AUDIT.md`
Admin login	New GIRZOCK sign-in screen: navy background, brand panel, white form card; eye toggle; inline validation; loading state; forgot link hidden, recovery kept; password managers supported, nothing stored	170 checks in three browsers: CSRF, new session at sign in, sign out, expiry, lockout after 5 failures
SEO metadata	Your homepage reference applied to the homepage only (keywords, Open Graph and X, hero image, geo, author, Search Console code). Extended robots line, image alt and size on every page. Organization: logo, description, areas served, LinkedIn and Facebook. Article on case studies; CollectionPage on listings	Combined SEO score 89/100 (internal checklist)
Products and jobs	Product pages expanded to 355 to 416 words with internal links; job descriptions and responsibilities added. No prices or invented facts	Content score 88.2 to 93.7
Admin SEO	Secondary keywords field, a live search-result preview and plain warnings (duplicates, missing alt, broken internal links) in every editor	52 pages given secondary keywords
Competitor research	Six real searches and three competitor sites. Nobody targets Thisaiyanvilai or Sattankulam; competitors rely on directories and templated town pages	`docs/COMPETITOR_RESEARCH_REPORT.md`

Database changes on the local real database, each after a backup: migrations 011 (popup settings), 012 (content and local SEO), 013 (popup reappearance), 014 (SEO fields and homepage metadata), 015 (product and job content) and 016 (secondary keywords), plus the LinkedIn and Facebook addresses. The live server has none of them yet. The Facebook link could not be checked automatically; open it once in a browser.

1. Project Overview

This report records an audit of the code, database and running local site on 7 November 2026. Earlier reports were not used as proof. Findings come from reading the source, read-only database queries, a fresh crawl and test runs. Recommendations are labelled separately from verified facts.

How the audit was kept safe

- The real site received GET and HEAD requests only. No form was submitted and nobody signed in.
- The real database received SELECT, SHOW and information_schema queries only during this audit.
- Tests that write data ran on an isolated database, `girzock_test`, with a separate private folder and fake keys. It has been removed.
- The live site received five read-only requests, to check redirects, the sitemap and robots.txt, plus one to read the homepage title.
- No password, key or SMTP credential was read into this report.

Changes made immediately before this audit

These came from earlier briefs, not from this audit, and are listed so the record is complete:

- Setting `favicon` now points to `assets/logos/girzock-favicon.webp`. The previous value is in `backups/favicon-setting-before-2026-11-07.sql`.
- The WhatsApp button, favicon and later edits are not committed to Git.
- `girzocl-loader.webp` was removed from the folder at 12:41, so the preloader currently uses `girzock-pre-logo.png` through a fallback. This needs an owner decision.

2. Technology Stack

Layer	Verified from the project
Framework	CodeIgniter 3.1.13 (`system/`, reported unmodified by the README)
PHP	8.2.12 locally
Database	MariaDB 10.4.32 locally, database `girzock_technologies`
Web server	Apache 2.4.58 with `mod_rewrite` and `mod_headers`; `mod_deflate` is not loaded locally
Front end	Bootstrap, Swiper, GSAP with ScrollTrigger, Lenis, Font Awesome, Fontello; Isotope and lightGallery files exist in `assets/js/vendor`
Fonts	Sora and Manrope from Google Fonts
Images	Uploads converted to WebP by `Media_manager` using GD, with 1200, 800 and 420 px copies
Secrets	Kept outside the project in `../girzock-private/.env`; SMTP password stored encrypted
Sessions	File-based, in the private folder
Schema changes	Sequential migrations 001 to 010, run by `php index.php setup migrate`

Required PHP extensions (from code use)

- `mysqli`, `mbstring`, `fileinfo` and `dom`.
- `gd` with WebP support, used for image uploads.
- `openssl`, used to encrypt and decrypt the stored SMTP password.

3. Complete Page Inventory

Routes, templates and records are counted separately. For example, 11 published blog posts share one detail template.

Group	Routes	Templates	Live records or URLs	Notes
1. Main public	1	1	1	Homepage
2. About	1	1	1	`/about`. The homepage also has an About section
3. Services	2	2	1 list + 16 detail	All active
4. Products	2	2	1 list + 6 detail	All published
5. Portfolio	2	2	1 list + 13 detail	Detail pages are noindex (sample concepts)
6. Case studies	2	2	1 list + 3 detail	Labelled sample concepts
7. Blog	6	2	1 list + 11 published; 7 category; 12 tags	20 drafts are not public
8. Careers	3	2	1 list + 6 detail	`/careers/apply` is POST only
9. Contact	2	1	1	`/contact/submit` is POST only
10. Location	1	1	1	`/areas-we-serve`; one page, no per-city pages
11. Legal	4	1	3	Privacy, Terms, Cookies; `/terms-and-conditions` redirects to `/terms`
12. System	4	2	Search, 404, 410, sitemap, robots	No thank-you page; forms answer in place
13. Admin	See section 7	21 screens	14 sidebar modules	Sign-in required

Totals

Measure	Count
Fixed public pages	13
Dynamic detail templates	6
Detail pages from those templates	55
Public page templates in total	19
Blog category URLs / tag URLs	7 / 12
Blog drafts, not public (20 tested)	20
URLs reached by the fresh crawl	89
HTTP 200 in that crawl	89
Sitemap URLs	61
Indexable pages in the crawl	62

Issues found in routes and links

Issue	Evidence	Status
Tag pagination	Fixed: `/blog/tag/business/page/2` now has its own route and shows page 2	**PASS**
Category with no posts	`/blog/category/digital-marketing` is now noindex and not in the sitemap	**PASS**
Broken links in the crawl	None. All 89 crawled URLs returned 200	**PASS**
Unknown detail URLs	All tested return 404 with noindex	**PASS**
Old `.html` addresses	301 to clean URLs	**PASS**

Issue	Evidence	Status
Unused views	Case study files `_studies`, `_lead`, `_process`, `_process_gallery`, `_video_banner` remain on disk but are not loaded	**PARTIAL**

4. Public Page-by-Page Details

Generated from the crawl of 7 November 2026. Views are relative to `application/views/frontend/`. "Admin editable" refers to the record behind the page.

5. Dynamic Detail-Page Architecture

Each content type has one reusable template. A slug in the URL selects the record, and an unknown or unpublished slug falls through to `url_redirects` and then to a 404.

Type	Route	Template	Table	Public rule	Live	Total
Service	`services/(:any)`	services/detail.php	services	status active	16	16
Product	`products/(:any)`	products/detail.php	products	status published	6	6
Portfolio	`portfolio/(:any)`	portfolio/detail.php	portfolio_projects	status published	13	13
Case study	`case-studies/(:any)`	case-studies/detail.php	case_studies	status published	3	3
Blog post	`blog/(:any)`	blog/detail.php	blog_posts	published or scheduled, and publish time passed	11	31
Career	`careers/(:any)`	careers/detail.php	career_openings	status active	6	6

Slug changes and deletion

- Saving a new slug stores a 301 from the old path automatically (`Admin_Crud_Controller::save`, `Settings_model::add_redirect`). Chains are updated so old links go straight to the newest URL.
- Deleting a record is a soft delete and adds a 410 rule for its URL.
- The `url_redirects` table has 0 rows today because no slug has changed on the real database.

6. Website Functionality

Frontend

Feature	What was verified	Status
Header and responsive navigation	Browser tests at many widths; mobile menu covered by the browser suite	**PASS**
Mega menu	234 checks on the isolated copy and 234 on the real site	**PASS**
Homepage hero and sliders	Browser suite; hero causes load-time layout shift (see section 14)	**PARTIAL**
Services and detail pages	16 pages respond; FAQ and structured data checked	**PASS**
Products	6 pages respond; images are older template artwork	**PARTIAL**
Portfolio	Filter and cards tested; labelled sample concepts; detail pages noindex	**PASS**
Case studies	3 pages respond; labelled "Sample concept, not a client project"	**PASS**
Blog and details	Listing, pagination (including tag pages), categories, sidebar, share links	**PASS**
Careers and applications	Application path tested on the isolated copy	**PASS**
Contact and enquiry forms	See section 12	**PASS**
Search	Pop-up search and `/search`, noindex. It covers services, products, portfolio, case studies, careers and blog	**PASS**
Theme switching	Light and dark tested in Chrome, Firefox and WebKit	**PASS**
WhatsApp button	438 checks: hidden at 0 and 699 px, visible at 700 px, 3 s shake	**PASS**
Back-to-top	Works and is unchanged	**PASS**
Preloader	Real progress, hides on load or after 3 s	**PASS**
Footer and social links	Same footer on every page. All four platforms are editable in Website Settings; all four links are live	**PASS**
Promotional popup	Admin-managed images, dates, delay, screens and reappearance rules; focus trap; Escape; no layout shift	**PASS**
Legal pages	Privacy, Terms and Cookie Policy, linked in every footer	**PASS**
Animations	Gradient outline text watched for 14 s on real pixels in 24 combinations	**PASS**

7. Admin Panel Modules and Functions

All admin URLs tested without signing in redirect to `/admin/login`. CRUD behaviour below comes from the isolated admin suite (291 passed, 0 failed) and the upload suite (77 passed, 0 failed), plus reading the code.

Module	What it does and how it is used	Tables	Create / View / Edit / Delete	Limitations
Sign-in and passwords	Sign in, lockout after failed attempts, forgotten-password email, forced change	`admin_users`, `login_attempts`, `password_resets`	n/a	No two-factor sign-in
Dashboard	Statistics, chart data, notifications and admin search	Several	View	Read only
Enquiries	List, view, status, assign, notes, archive, delete, resend email, CSV export	`contact_enquiries`, `enquiry_notes`, `enquiry_history`	V / E / D	Created by public forms only
Services	Content, FAQs, menu, form label, order, images, SEO	`services`, `seo_metadata`	C / V / E / D	Footer lists the first 9
Products	Content, category, image, SEO	`products`, `seo_metadata`	C / V / E / D	None found
Portfolio	Project cards, category, image, SEO	`portfolio_projects`	C / V / E / D	None found
Case Studies	Study content, labels, gallery, SEO	`case_studies`	C / V / E / D	None found
Blog Management	Rich text, status, schedule, category, tags, image, alt text, SEO	`blog_posts`, `blog_tags`, `blog_post_tags`	C / V / E / D	No duplicate-title warning
Careers	Openings, closing date, applications on or off	`career_openings`	C / V / E / D	No salary field
Job Applications	View, update status, download resume, archive	`job_applications`	V / E / archive	Created by the public form only
Media Library	Upload to WebP, picker, alt text, delete	`media_library`	C / V / E / D	Imagick path untested
Categories	Blog, portfolio and product categories	`blog_categories`, `content_categories`	C / V / E / D	None found
SEO Management	Page SEO and redirect rules	`seo_metadata`, `url_redirects`	C / V / E / D	Focus keyword is for reference only
Admin Users	Users, roles, permissions per module	`admin_users`, `admin_roles`, `admin_permissions`	C / V / E / D	None found
Website Settings	Company, contact, social links (LinkedIn, Facebook, Instagram, WhatsApp, with URL checks), branding, SMTP, test email	`website_settings`, `social_links`	V / E	A favicon can be replaced, not cleared, in the panel
Promotional Popup	On/off, title, description, images, alt text, delay, dates, screens, reappearance rules, reset visitor dismissals, previews	`website_settings`, `media_library`	V / E / D (images)	One popup at a time
Profile	Own details and password	`admin_users`	V / E	None found

Blog "delete" and other CRUD deletes are soft deletes. Roles on the real database: Super Admin, Content Editor, Enquiry Manager and HR Manager. One active admin account exists, on the Super Admin role.

8. Database Architecture

Database `girzock_technologies` on MariaDB 10.4.32 has 28 tables. Installation uses `database/girzock_technologies.sql`, and later changes use migrations 001 to 016.

Table	Purpose	Primary key	Rows	Foreign keys
`activity_logs`	Admin audit trail	id	22	admin_id -> admin_users.id
`admin_permissions`	Per-role, per-module rights	id	14	role_id -> admin_roles.id
`admin_roles`	Roles	id	4	none
`admin_users`	Admin accounts (bcrypt password hash)	id	1	role_id -> admin_roles.id
`blog_categories`	Blog categories	id	7	none
`blog_posts`	Blog articles and drafts	id	31	author_id -> admin_users.id; category_id -> blog_categories.id
`blog_post_tags`	Post-to-tag links	post_id, tag_id	87	post_id -> blog_posts.id; tag_id -> blog_tags.id
`blog_tags`	Blog tags	id	27	none
`career_openings`	Job openings	id	6	none
`case_studies`	Case studies	id	3	none
`contact_enquiries`	Enquiries from all forms	id	3	assigned_to -> admin_users.id
`content_categories`	Portfolio and product categories	id	8	none
`email_log`	Email send results, one per recipient	id	7	none
`enquiry_history`	Enquiry change history	id	3	admin_id -> admin_users.id; enquiry_id -> contact_enquiries.id
`enquiry_notes`	Internal enquiry notes	id	0	admin_id -> admin_users.id; enquiry_id -> contact_enquiries.id
`job_applications`	Job applications and resume references	id	1	career_id -> career_openings.id
`login_attempts`	Sign-in lockout data	id	5	none
`media_library`	Uploaded images	id	3	uploaded_by -> admin_users.id
`migrations`	Schema version (now 16)	none	1	none
`password_resets`	Hashed reset tokens	id	1	user_id -> admin_users.id
`portfolio_projects`	Portfolio entries	id	13	case_study_id -> case_studies.id; category_id -> content_categories.id
`products`	Products	id	6	category_id -> content_categories.id
`seo_metadata`	SEO fields for pages and records	id	91	none
`services`	Services, menu and form labels	id	16	none
`social_links`	Social profile links	id	4	none
`submission_throttle`	Form rate limiting	id	4	none
`url_redirects`	301 and 410 rules	id	0	none
`website_settings`	Settings, branding, encrypted SMTP password	setting_key	50	none

Integrity checks (all read-only)

Check	Found
blog_posts missing category	0
posts with no category	0
post_tags without post or tag	0
tags used by no post	0
portfolio with missing case study	0
portfolio with missing category	0
seo rows for blog posts that no longer exist	0
seo rows for services that no longer exist	0
published posts without featured image	0
published posts without seo row	0
published posts without alt	0

Check	Found
duplicate blog titles	0

Findings

Area	Finding	Status
Indexes	Slugs, statuses, foreign keys, public blog query and full-text blog search are indexed. No missing index was found for the reviewed public queries	**PASS**
`migrations` table	Has no primary key; this is the CodeIgniter design	**PASS**
Query performance	Local HTML response averaged 68 ms, 148 ms at most, across 85 pages	**PASS**
Blog tags	All 27 tags are used; no orphan links	**PASS**
Rollback	Migration `down()` methods deliberately do not revert content, so rollback means restoring a backup	**PARTIAL**

9. SEO Implementation

The `Seo` library (`application/libraries/Seo.php`) builds metadata for every public page. For each field it uses the admin value in `seo_metadata` first, then a value from the page, then the site default.

9.1 On-page SEO

Element	How it works	Source	Result in the crawl	Status
SEO title	Admin value, else "Title | Company"	Auto + admin	0 missing; 0 duplicates among indexable pages	PASS
Meta description	Admin value, else excerpt or summary	Auto + admin	0 missing; 0 duplicates; 0 over 160 characters on indexable pages	PASS
Meta keywords	Not output; focus keyword is for admin reference	n/a	0 pages	NOT IMPLEMENTED
Canonical	Admin value, else clean URL using `PUBLIC_URL`	Auto + admin	Present and self-referencing on every crawled page	PASS
Robots meta	Default index; tags, search, portfolio details, empty categories noindex	Auto + admin	62 indexable, 27 noindex	PASS
Open Graph	Title, description, image, type	Auto + admin	Image present on all	PASS
Twitter card	`summary_large_image`, or `summary` with the default image	Auto	Present on all	PASS
Headings	One H1 per page	Templates	0 pages with other than one H1; posts rewritten with H2 sections	PASS
Image alt	Admin alt, else the title	Auto + admin	0 images without the attribute; 546 empty alt values across pages, mainly decorative repeats	PARTIAL
Breadcrumbs	Visible trail and `BreadcrumbList`	Auto	On all except the homepage	PASS
URL slugs	From the title, unique, editable	Auto + admin	Clean, lower-case	PASS
Duplicate detection	No warning in the admin panel	n/a	Checked by this audit only	NOT IMPLEMENTED

The six older posts were rewritten with H2 and H3 sections in migration 012.

9.2 SEO requirements by page type

Page type	SEO title / description	H1	Canonical	Schema	Internal links	Images	Index?
Homepage	Admin, under 60 / 120-160 characters	Company proposition	Root URL	Organization, WebSite	Services, blog, contact	Alt text; compress hero	Index
About	Admin	Page name	Self	WebPage, Breadcrumb	Services, contact	Meaningful alt	Index
Service	Admin, with service and place	Service name	Self	Service	Related services, contact	Detail image alt	Index
Product	Admin	Product name	Self	Product	Related, contact	Replace template art	Index
Portfolio detail	Auto	Project name	Self	WebPage	Listing	Alt set	Noindex (samples)
Case study	Admin	Study title	Self	WebPage	Services	Alt set	Index, with sample label
Blog listing	Admin for page 1; auto later	Blog title	Self per page	WebPage	Posts, categories	Alt set	Index
Blog post	Admin, else auto	Post title	Self	BlogPosting	Related, tags, prev/next	Alt required	Index
Careers	Admin	Job title	Self	JobPosting	Listing, apply	n/a	Index if genuine
Contact	Admin	Page name	Self	ContactPage	Services	n/a	Index
Areas We Serve	Admin	Page name	Self	WebPage	Services, contact	Alt set	Index
Legal	Set in code, 140 to 152 characters	Policy name	Self	WebPage, Breadcrumb	Footer	None	Index
Tags, search, 404, admin	Auto	Page name	Self	WebPage	n/a	n/a	Noindex (verified)

9.3 SEO scorecard (internal checklist, not a Google score)

> Google publishes no SEO score. This scorecard counts measurable practices on the local build. A high score does not guarantee any search position. Full method: `docs/COMPLETE_SEO_SCORE_REPORT.md`.

Category	Score /100	Weight	Measured on
Crawlability and indexability	99.7	15%	site-wide checks, 89 crawled URLs
Titles and meta descriptions	99.0	12%	62 indexable pages
Heading structure	100.0	6%	62 indexable pages
Content depth and uniqueness	93.7	15%	62 indexable pages
Internal linking	90.0	10%	62 indexable pages
Structured data	96.0	10%	62 indexable pages
Images and alt text	100.0	5%	923 images on 62 indexable pages
Social sharing and mobile tags	100.0	5%	62 indexable pages
Page speed (Lighthouse mobile)	56.6	12%	11 Lighthouse runs
Local SEO	66.9	10%	site-wide checks
Overall (equal weight)	**90.2**		
Combined (weighted)	**89.0**	100%	

Weakest areas: local SEO (no street address, map coordinates or Google Business Profile link in the data), job openings and product pages (short, mostly shared template text). The content audit lists what to add.

10. New Blog Publishing and SEO Workflow

This explains what happens when you publish "Why Every Business Needs a Professional Website in 2027". The steps come from the code and the isolated test suite. This example post has not been created.

> The blog workflow was tested on the isolated copy, not on the real database or the live server. Status: PARTIAL until repeated once on production.

#	Step	What you do	Type
1	Sign in	Open `/admin/login`	Manual
2	Open Blog Management	Choose it in the sidebar (`/admin/blog`)	Manual
3	Add a post	Open `/admin/blog/create`	Manual
4	Title	Up to 200 characters. Required	Admin-entered
5	Slug	Created from the title if left blank; made unique automatically	Automatic, editable
6	Content	Rich text editor; cleaned of scripts on save. Excerpt is optional and feeds the default description	Admin-entered
7	Category and tags	Choose a category; type tags with commas, and new tags are created	Admin-entered
8	Featured image	Upload JPG, PNG, WebP or still GIF up to 5 MB. Converted to WebP with smaller copies	Admin + automatic
9	Alt text	Describe the image. If blank, the title is used	Admin, with fallback
10	SEO title	Optional. If blank: "Title | GIRZOCK Technologies"	Admin, with fallback
11	Meta description	Optional; aim for 120 to 160 characters	Admin, with fallback
12	Canonical URL	Leave blank unless the main copy is elsewhere	Optional
13	Social details	Optional Open Graph title, description and image	Optional
14	Save as draft	Status Draft: not public	Manual
15	Preview	Add `?preview=1` while signed in. Preview pages are noindex	Manual
16	Publish	Status Published (time defaults to now), or Scheduled for a future time	Manual

What happens automatically after publishing

Result	Status
Detail page becomes accessible at `/blog/<slug>`	**PASS**
Post appears first in the blog listing and in its category	**PASS**
Title and meta description are generated or taken from the admin fields	**PASS**
Canonical URL is included	**PASS**
BlogPosting and BreadcrumbList data are generated	**PASS**
Featured image becomes the Open Graph image, with `og:type` article	**PASS**
XML sitemap includes the post on its next request, with lastmod	**PASS**
Links are added: related posts, previous and next, category, tags, sidebar recent posts	**PASS**
Scheduled posts go live on time with no cron job	**PASS**
Search engines are notified	**NOT IMPLEMENTED**

Who does what

Automatic	Admin-entered	Manual tasks	Not supported
Slug, WebP copies, reading time, canonical, schema, sitemap, breadcrumbs, related links, redirects	Title, content, category, tags, image, alt text, optional SEO fields	Linking from older posts, sharing, Search Console inspection, checking results	Meta keywords, duplicate warnings, search engine pings, automatic alt text, SEO scoring

Worked example

Field	Example value
Blog title	Why Every Business Needs a Professional Website in 2027
SEO title	Why Your Business Needs a Professional Website in 2027
Meta description	See what a professional website does for enquiries, trust and search visibility in 2027, and what to plan before you build or redesign yours.
URL slug	why-every-business-needs-a-professional-website-in-2027
H1	Why Every Business Needs a Professional Website in 2027
Featured image file	Uploaded as any name; stored as a generated `.webp` name in `assets/uploads/YYYY/MM/`
Image alt text	Business owner reviewing a company website on a laptop and phone
Open Graph title	Why Your Business Needs a Professional Website in 2027
Open Graph description	What a professional website does for enquiries, trust and search visibility.
Canonical URL	https://girzock.com/blog/why-every-business-needs-a-professional-website-in-2027

BlogPosting data has this structure. Dates, image and author are illustrative; the system fills them from the post:

```
{
  "@context": "https://schema.org",
  "@type": "BlogPosting",
  "headline": "Why Every Business Needs a Professional Website in 2027",
  "description": "See what a professional website does for enquiries...",
  "image": "https://girzock.com/assets/uploads/YYYY/MM/generated-name.webp",
  "datePublished": "<publish time>",
  "dateModified": "<last saved time>",
  "author": { "@type": "Organization", "name": "GIRZOCK Team" },
  "publisher": { "@type": "Organization", "name": "GIRZOCK Technologies", "url": "https://girzock.com/"
},
  "mainEntityOfPage": "https://girzock.com/blog/why-every-business-needs-a-professional-website-in-
2027"
}
```

Updating an existing post

If you change	What happens	What you should do
Title	H1 and default SEO title change. The slug stays unless you edit it	Review the SEO fields, which override it if filled
Slug	A 301 from the old URL is created automatically	Update your manual links; inspect the new URL in Search Console
Featured image	Page and social image change; `dateModified` updates	Update the alt text; re-scrape in social debuggers
Content	`dateModified` and sitemap lastmod update	Request indexing only for significant changes
Delete	Soft delete; URL answers 410	Remove internal links

Search engine indexing workflow

1. **Google Search Console:** verify `girzock.com`. The Settings field `gsc_verification` is empty today and can hold the meta tag value.
2. **Bing Webmaster Tools:** add the site, or import it from Search Console.
3. **Sitemap:** submit `https://girzock.com/sitemap.xml` to both, once.
4. **URL inspection:** check an important new post, then use Request Indexing.
5. **Coverage:** review the pages report regularly. Noindex on tags, search and portfolio details is intentional.
6. **Excluded or duplicate pages:** check the canonical Google selected, then fix the content or links, not just the tag.

> Submitting a sitemap or requesting indexing does not guarantee indexing, timing or rankings.

11. Technical SEO and Schema Report

11.1 Technical SEO

Element	Verified result	Status
XML sitemap	`/sitemap.xml` is built per request: 61 URLs, 42 with lastmod, no noindex or broken entries	PASS
robots.txt	Blocks `/admin/`, `/search`, `/contact/submit`, `/careers/apply`, and names the sitemap	PASS
Canonical consistency	Depends on setting `PUBLIC_URL` in production; currently local	PARTIAL
HTTPS and redirect	Rules exist but are commented out in `.htaccess`. The current live server already redirects	NOT TESTED
WWW / non-WWW	Same; live server redirects `www` to the bare domain	NOT TESTED
404, 301, 410	404 pages tested; legacy 301s tested; 410 confirmed in code and admin suite	PASS
Pagination	Each blog, category and tag page has its own canonical, title and prev/next	PASS
Mobile friendliness	No sideways scroll across 59 pages at 375 and 1440 px	PASS
Page speed	Mobile Lighthouse 50 to 59, measured locally without compression	PARTIAL
Core Web Vitals field data	None exists until the site has real visitors	NOT TESTED

11.2 Structured data

Type	Where	Pages	Assessment	Status
Organization + ProfessionalService	Every page	89	Facts come from Settings. Address has locality, region and country, with no street. `sameAs` lists Instagram only	PASS
WebSite with SearchAction	Homepage	1	Points to the working `/search`	PASS
WebPage / ContactPage	Every other page	61 / 1	Valid	PASS
BreadcrumbList	All except homepage	88	Valid	PASS
BlogPosting	Published posts	11	Author is typed Organization ("GIRZOCK Team")	PASS
Service	Service pages	16	Area served lists service areas, not offices	PASS
Product	Product pages	6	No offers or reviews, so Google product rich results may not apply. Do not invent them	PARTIAL
JobPosting	Career pages	6	No `validThrough` or salary. Publish only for genuine vacancies	PARTIAL
LocalBusiness	Not used	0	ProfessionalService is used instead	NOT IMPLEMENTED
Article, FAQPage, reviews, ratings	Not used	0	No fake reviews or ratings found	NOT IMPLEMENTED

All JSON-LD on the 89 crawled pages parsed without errors. Google's Rich Results Test was not run because it needs a public URL. Status: NOT TESTED.

12. Forms and Integrations

Check	Homepage enquiry	Contact page	Short form (other pages)	Careers application
Frontend validation	PASS	PASS	PASS	PASS
Backend validation	PASS	PASS	PASS	PASS
CSRF token present	PASS	PASS	PASS	PASS
Saved to database	PASS	PASS	PASS	PASS
Notification email (mail catcher)	PASS	PASS	PASS	PASS
Client confirmation (mail catcher)	PASS	PASS	PASS	NOT IMPLEMENTED
Honeypot and rate limit	PASS	PASS	PASS	PASS
Success and error messages	PASS	PASS	PASS	PASS
Reply before email (fast)	PASS	PASS	PASS	n/a
Admin management	PASS	PASS	PASS	PASS
Real email delivery	PARTIAL	NOT TESTED	NOT TESTED	NOT TESTED

Enquiries save first, the visitor gets the reply at once, and the two emails are sent after the reply. Measured: 6,123 ms before and 46 ms (median, final run; 43 to 60 ms in earlier runs) after, with a deliberately slow mail server. A mail failure is logged per recipient and can be retried with Resend in the admin. The popup enquiry is marked PARTIAL for real email because your own two popup enquiries were delivered through the real SMTP account. Duplicates are recognised by a content hash. The limits per connection are 5 enquiries per 10 minutes and 5 applications per hour. Only a company notification template exists for applications (`application_company.php`), which is why no applicant confirmation is listed.

Integrations

Integration	State	Status
SMTP email	Host, port, user and encrypted password are stored (values not shown). Sign-in verified; your two popup enquiries were delivered through the real account. Repeat on the live server	PARTIAL
Google Analytics	Code ready; `google_analytics_id` is empty	NOT IMPLEMENTED
Google Search Console	Field ready; `gsc_verification` is empty	NOT IMPLEMENTED
Fonts	Sora and Manrope self-hosted as WOFF2; no Google Fonts request	PASS
WhatsApp	Links to `https://wa.me/916379362330`; clicks intercepted in tests	PASS
Instagram	Link opens in a new tab; clicks tested with the request answered locally	PASS
LinkedIn, Facebook	Your official addresses saved; icons live on every page and in the Organization data. LinkedIn confirmed; Facebook blocks automated checks, so open it once in a browser	PARTIAL
Share links on posts	LinkedIn, Facebook and WhatsApp links built from the canonical URL	PASS

13. Security Audit

Area	Verified finding	Status
SQL injection	Query Builder and bound parameters. Raw queries found use placeholders	PASS
XSS	Output escaping with `e()`; rich text passes through `Html_sanitizer`; hostile text tested	PASS
CSRF	`csrf_protection` on; missing or wrong token returns 403 (tested)	PASS
Authentication	Bcrypt hashes, session regeneration at sign-in, lockout, 15-minute wait	PASS
Authorization	Roles and per-module rights tested	PASS
Password resets	Tokens stored as SHA-256 hashes with expiry	PASS
Upload validation	Real MIME type, extension list, dimension limits, 5 MB limit, re-encoding; PHP in uploads blocked	PASS
Private files	12 sensitive paths returned 403, including `.env`, `.git/HEAD` and config. `/setup/migrate` and `/phpinfo.php` return 404	PASS
Secrets	Stored outside the web root; SMTP password encrypted	PASS
Error display	Off only when `APP_ENV=production`; local is development	FAIL
Session cookies	HttpOnly and SameSite set. `COOKIE_SECURE=0` locally	FAIL
HTTPS and HSTS	Redirect rules commented out; HSTS not set	FAIL
Content-Security-Policy	Not set	FAIL
Version disclosure	`X-Powered-By` removed in `.htaccess`. The Server header is set by the host	PARTIAL
Duplicate header	Fixed: `X-Frame-Options` is sent once, by PHP	PASS
Two-factor sign-in	Absent	NOT IMPLEMENTED
External penetration test	Not performed	NOT TESTED
Gmail App Password	Recommended to rotate before launch because it was handled during setup. No credential value was read here	NOT TESTED

Recommendation: add `Strict-Transport-Security` once HTTPS is confirmed. Test a Content-Security-Policy in report-only mode first, because the site uses inline scripts.

14. Performance Audit

Lighthouse, mobile, on the local server (final run of 7 November 2026)

Page	Performance	SEO	Accessibility	Best practices	LCP	CLS	Weight
/about	59	100	96	96	17.19 s	0.003	3.2 MB
/areas-we-serve	57	100	100	100	16.21 s	0	2.92 MB
/blog	57	100	100	100	17.41 s	0	3.24 MB
/careers/web-developer	57	100	96	100	16.21 s	0	2.92 MB
/contact	57	100	100	100	16.89 s	0.003	3.82 MB
/	50	100	97	93	17.64 s	0	3.58 MB
/blog/how-to-plan-a-business-website-that-generates-enquiries	57	100	100	100	16.81 s	0	2.99 MB
/privacy-policy	56	100	100	100	15.61 s	0	2.5 MB
/products/customer-portal	56	100	100	96	16.36 s	0	2.93 MB
/services/website-development	58	100	100	100	16.66 s	0	2.99 MB
/services	59	100	95	100	17.71 s	0	3.3 MB

These scores use simulated slow mobile conditions on this PC, with compression off. Scores vary between runs. They are not production measurements. The home page was 8.48 MB before the video was made to load on scroll.

Item	Measured	Status
Largest homepage files	The 4,793 KB video now loads only near the screen. `style.min.css` 608 KB remains	PARTIAL
Compression	Off locally because `mod_deflate` is not loaded. `.htaccess` now includes `text/javascript`. Must be on in production	PARTIAL
Render-blocking	Estimated saving 4,800 ms	FAIL
Unused CSS / JS	Estimated 838 KB / 197 KB	PARTIAL
Browser caching	30 days for static files, with version numbers on CSS and JS	PASS
WebP	53 WebP files served during the audit, 0 with a wrong type; 488 WebP and 292 PNG in `assets/images`	PARTIAL
Lazy loading	13 readings of 4 below-the-fold images without it	PARTIAL
Image dimensions	68 readings of 23 images without width and height, mostly SVGs	PARTIAL
Unused assets	90 image files (3.3 MB) not referenced anywhere; listed in `PERFORMANCE_OPTIMIZATION_REPORT.md`, not deleted	PARTIAL
Duplicate libraries	No duplicate CSS or JS loaded on the 59 audited pages	PASS
Console errors	None in the final WhatsApp, preloader and outline-text runs	PASS
Broken images and links	None in the audit	PASS
Layout shift	Comes from the hero during load; none attributed to the animated text	PARTIAL
Accessibility basics	Lighthouse 95 to 100. Placeholder social icons removed	PASS
Core Web Vitals	No field data exists yet	NOT TESTED

Recommendation, in order of benefit: enable compression on the server, then trim unused CSS and compress the large PNG layers.

15. Test Results

> Counts are from executed runs. Isolated means the separate test database; real means read-only requests to the local site. Nothing here ran against production.

Test category	Total tests	Passed	Failed	Not tested
Content (isolated and real)	1624	1624	0	0
Public site, forms, browser (isolated)	268	268	0	0
Admin, uploads, favicon (isolated)	390	390	0	0
Admin login redesign and security (isolated)	170	170	0	0
SEO (isolated and real)	324	324	0	0
Promotional popup (isolated and real)	737	737	0	0
Social links (isolated and real)	1387	1387	0	0
Email retry (isolated)	6	6	0	0
Menus, dropdown, tabs, orbit, panel (isolated and real)	1559	1559	0	0
Visual effects, outline text, preloader, WhatsApp, fields (real)	2918	2907	11	0
Production deployment steps	12	0	0	12
Total	**9395**	**9372**	**11**	**12**

What each row contains

Notes on this run

- All 11 failures are one Firefox reading of the gap from "Technologies" to ABOUT. Firefox reports 0 height for text inside an SVG mask; a pixel measurement found 24 to 33 px, within target, and the check passes in Chromium and WebKit.
- Two real faults were found and fixed in this pass: the new eye toggle moved focus into the password field, and the fourth footer icon wrapped at 320 px. The other failures during the work were test timing and test setup, all corrected.
- Homepage comparison against the 18:48 capture: 352 sections, no image changed, no console errors. The only height change was the 320 px footer row, now fixed.
- Real data unchanged: migration 16, 2 enquiries (your own), 0 applications, the same admin, SMTP and .env checksums, no PHP errors.
- Production deployment steps are not performed until you approve.

Not tested

- Anything on the production server, including the HTTPS redirect and production email.
- Real Safari (WebKit stood in) and real phones.
- The visible browser tab icon, other than through Chrome's stored icon and your screenshots.
- The Imagick upload path, external security scans, Rich Results Test and social sharing debuggers.
- An external plagiarism check.

16. Production Deployment Guide

The live site answers from a server whose provider was not verified, so confirm these against your hosting panel. The steps assume Apache, as in this project.

Server requirements

Item	Requirement
PHP	8.2 was tested. Extensions: mysqli, mbstring, fileinfo, dom, openssl, and gd with WebP
CodeIgniter	3.1.13 is bundled. PHP 8.2 raises deprecation notices that stay out of the page with production settings
Database	MariaDB 10.4 was tested; MySQL support is stated in the README, not tested
Apache	`mod_rewrite` required; `mod_headers` and `mod_deflate` recommended; `AllowOverride All`
Document root	The `girzock-website` folder contents. `.htaccess` blocks `application`, `system`, `database` and `docs`, so it must take effect
HTTPS	A valid certificate before enabling the redirect and `COOKIE_SECURE`
Private folder	`girzock-private` one level above the web root, holding `.env`, `logs`, `sessions`, `resumes`
Writable	`assets/uploads` and the private folder's `logs`, `sessions`, `resumes`. Everything else read-only
Do not upload	`.git`, `.claude`, `docs`, local backups, test files

Deployment steps

1. **Back up production:** download the existing live files and database before changing anything.
2. **Prepare the database:** create the database and a dedicated user with rights to that database only.
3. **Export and import:** export the local database, because it holds the current content, including migration 16. Import it on the server. Delete your own test enquiries first if you do not want them on the live site.
4. **Set the environment:** in the private `.env`, set `APP_ENV=production`, plus `APP_TIMEZONE`. Copy `ENCRYPTION_KEY` and `SECRET_BOX_KEY` exactly. A different `SECRET_BOX_KEY` makes the stored SMTP password unreadable.
5. **Base URL:** set `BASE_URL=https://girzock.com/` and `PUBLIC_URL=https://girzock.com`.
6. **Database credentials:** set `DB_HOST`, `DB_NAME`, `DB_USER`, `DB_PASS` in the private `.env` only.
7. **SMTP:** rotate the Gmail App Password, then enter it in Admin > Website Settings.
8. **Upload paths:** upload `assets/uploads`, keeping its `.htaccess`. Confirm it is writable.
9. **Rewrite rules:** confirm clean URLs work and `/.env` returns 403.
10. **HTTPS redirects:** uncomment the four rules at the top of `.htaccess`, set `COOKIE_SECURE=1`, then sign in again.
11. **Favicon, preloader and fonts:** confirm `girzock-favicon.webp`, the preloader logo and `assets/fonts/*.woff2` return 200.
12. **Public routes:** crawl every URL in `/sitemap.xml`.
13. **Admin:** sign in at `/admin/login` and open each module.
14. **Forms:** submit one real enquiry on each form, then delete the test entries in the admin panel.
15. **Email:** use "Send test email" in Settings. Confirm arrival at `girzock@gmail.com` and at a client mailbox.
16. **Blog:** publish one test post, confirm its page and sitemap entry, then unpublish it. Also add the cron job `php index.php setup retry_emails`.
17. **Sitemap and robots:** confirm `Sitemap:` in robots.txt shows `https://girzock.com/sitemap.xml`.
18. **Mobile:** check key pages on real Android and iPhone devices.
19. **Security:** check headers, confirm display errors are off, and confirm the private paths return 403.
20. **Smoke test:** rerun Lighthouse, run the Rich Results Test on a post and a service, submit the sitemap and watch the logs for 48 hours.

If the server has no command line, run migrations locally first and import the resulting database. The email retry cron then needs the host's scheduler.

Production URLs

Routes verified locally. On production, only redirects, the homepage title and sitemap response were checked.

Page	URL
Homepage	https://girzock.com/
Admin login	https://girzock.com/admin/login
Sitemap	https://girzock.com/sitemap.xml
robots.txt	https://girzock.com/robots.txt (404 today, until deployed)
Contact	https://girzock.com/contact
Blog listing	https://girzock.com/blog
Blog detail example	https://girzock.com/blog/why-small-businesses-in-tirunelveli-need-a-professional-website
Service listing	https://girzock.com/services
Service detail example	https://girzock.com/services/website-development

Backups

- Before launch: full files and database, stored off the server.
- After launch: daily database and weekly uploads and resumes, with a restore rehearsal. This is a recommendation; no automated backup exists in the project.
- Keep a safe copy of `.env`. Losing `SECRET_BOX_KEY` means re-entering the SMTP password.

17. Missing Features and Limitations

Item	Detail	Status
Legal review	Privacy, Terms and Cookie pages exist; not yet reviewed by a lawyer	PARTIAL
Cookie consent	No banner found; analytics is off today. Needed depends on your legal advice	NOT IMPLEMENTED
Applicant confirmation email	Only the company is notified	NOT IMPLEMENTED
Duplicate SEO warnings	None in the admin panel	NOT IMPLEMENTED
Search engine notification	Manual	NOT IMPLEMENTED
Per-city location pages	One `/areas-we-serve` page	NOT IMPLEMENTED
Two-factor sign-in	Absent	NOT IMPLEMENTED
Clearing the admin favicon	Replace only	PARTIAL
Older template images	Products, some Services cards (one shows an X shape), About	PARTIAL
"Work With" logos	Fictional template companies; licence unconfirmed	PARTIAL
AI-generated people	Images do not show staff or clients and must not be presented as such	PARTIAL
Service claims	Digital Marketing, Mobile, SEO and CRM experience not confirmed by the owner	NOT TESTED
"Pan India & Global" label	Broader than the page text, which names Tamil Nadu and nearby Kerala	PARTIAL
Drafts	20 drafts use older images; two link to other drafts. The six short published posts were rewritten	PARTIAL
Local business data	No street address, PIN code, map coordinates or Google Business Profile link stored	PARTIAL
Thin page types	Job openings and products are short and mostly template text	PARTIAL

18. Final Recommendations

Before launch

1. Have the Privacy, Terms and Cookie pages reviewed.
2. Complete the 20 deployment steps, including rotating the Gmail App Password.
3. Confirm the six vacancies, service claims and "Work With" logos.
4. Turn on compression on the server, then re-measure speed on production.
5. Give the street address and PIN code, and create or claim the Google Business Profile.

Soon after launch

1. Set up Search Console and Bing, then submit the sitemap.
2. Add LinkedIn and Facebook URLs in Website Settings if the profiles exist; the icons then appear.
3. Fill in job role details, product details and case study results.
4. Add a Google Analytics ID if you want analytics, along with the consent your legal adviser recommends.
5. Replace template images on Products and Services.
6. Add a Content-Security-Policy, starting in report-only mode.

Owner decisions

- Alangulam: it has been in Tenkasi District since 2019, so it is not listed under Tirunelveli. Add it under Tenkasi if you serve it.
- Commit the current uncommitted work to Git. Nothing is committed unless you ask.
- Approve deployment to the live server. Nothing is deployed without your approval.

19. Production Readiness Status

Area	Status	Reason
Public site functions	**PASS**	9,372 checks passed, 11 failed, all one Firefox measurement method; 0 functional failures
Admin panel	**PASS**	Admin, upload and popup admin suites on the isolated copy
Forms, database save	**PASS**	Saved before the reply; reply in 46 ms (median, final run; 43 to 60 ms in earlier runs)
Forms, real email	**PARTIAL**	SMTP sign-in verified; your two popup enquiries were delivered
SEO system	**PASS**	Internal score 89/100; gaps listed in 9.3
New blog workflow	**PARTIAL**	Tested on the isolated copy; indexing is manual
Security in code	**PASS**	Injection, XSS, CSRF, auth and uploads checked
Security in production settings	**FAIL**	HTTPS, secure cookies and production mode not applied
Legal	**PARTIAL**	Pages exist; legal review pending
Performance	**PARTIAL**	Mobile Lighthouse 50 to 59 locally, compression off
Deployment	**NOT TESTED**	Not performed on this build

> **Final status: ready to deploy, not production-ready until deployed and smoke-tested.** The remaining items are deployment settings and owner decisions, listed in the Executive Summary. Deployment waits for your approval.

20. Appendix: Verified Routes and File References

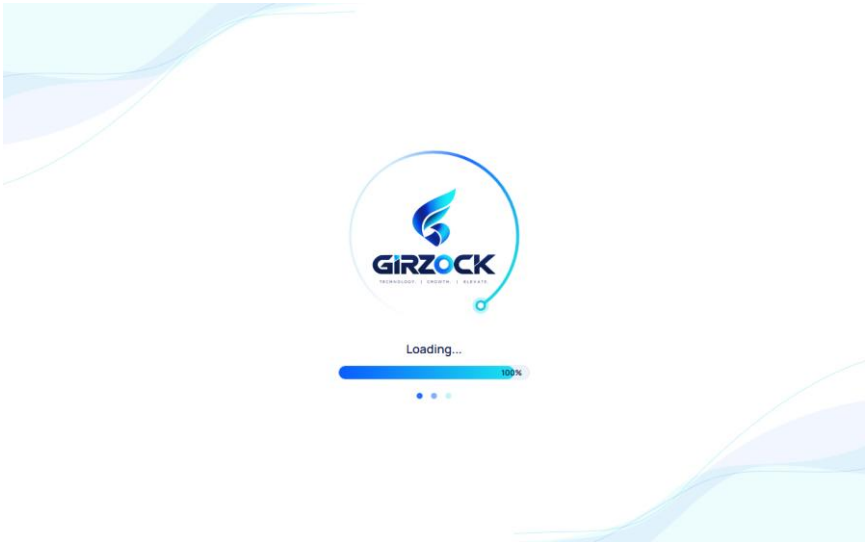

Public routes (`application/config/routes.php`)

Route	Target
`/`	Home::index
`about`	Home::about
`areas-we-serve`	Home::areas
`search`	Search::index
`services`, `services/(:any)`	Services::index, detail
`products`, `products/(:any)`	Products::index, detail
`portfolio`, `portfolio/(:any)`	Portfolio::index, detail
`case-studies`, `case-studies/(:any)`	CaseStudies::index, detail
`blog`, `blog/page/(:num)`	Blog::index
`blog/category/(:any)` and `/page/(:num)`	Blog::category
`blog/tag/(:any)`	Blog::tag
`blog/(:any)`	Blog::detail
`careers`, `careers/(:any)`	Careers::index, detail
`careers/apply`	Careers::apply (POST)
`contact`	Contact::index
`contact/submit`	Contact::submit (POST)
`sitemap.xml`, `robots.txt`	Sitemap::index, robots
`index.html`, `index8.html`, `(page).html`	Redirects::legacy (301)
`404_override`	Errors::not_found
`admin`	admin/Dashboard::index
`admin/login`, `logout`, `forgot-password`, `reset-password/(:any)`	admin/Auth
`admin/case-studies...`, `admin/job-applications...`	admin/CaseStudies, Applications
Other `admin/<module>/...`	CodeIgniter default routing to `controllers/admin/`

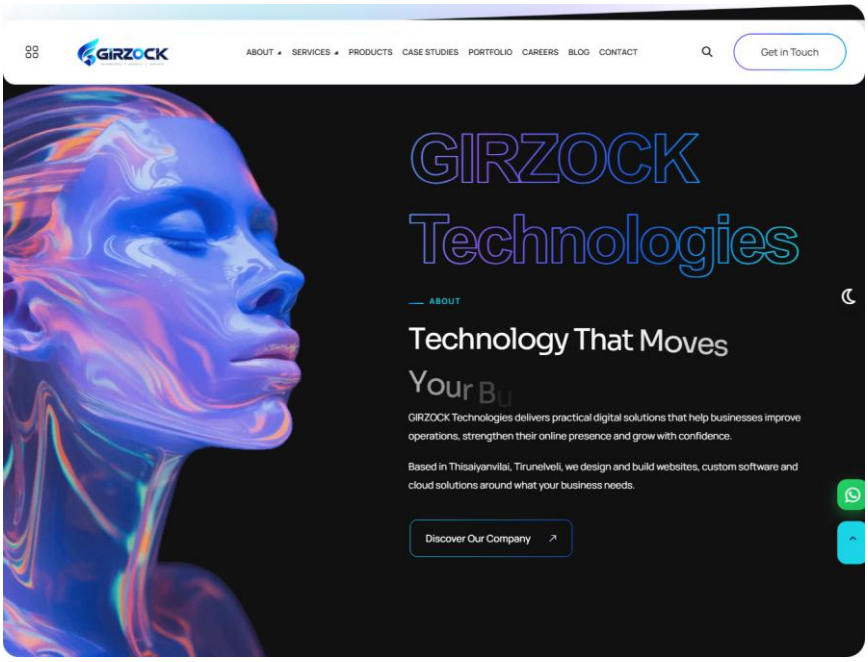

Important files

File	Role
`application/libraries/Seo.php`	Metadata and structured data
`application/controllers/Sitemap.php`	Sitemap and robots
`application/core/Admin_Crud_Controller.php`	Shared admin CRUD, slugs, SEO saving
`application/controllers/Contact.php`	Enquiry validation and saving
`application/libraries/Enquiry_mailer.php`, `Mailer.php`	Email
`application/libraries/Media_manager.php`	Upload validation and WebP
`application/libraries/Html_sanitizer.php`	Rich text cleaning
`application/libraries/Admin_auth.php`	Sign-in and permissions
`application/helpers/girzock_helper.php`	`asset()`, `site_favicon()`, `preloader_logo()`
`application/views/frontend/partials/flow_text.php`	Shared outline text
`.htaccess`	Rewrites, private-file rules, headers, caching
`docs/env.example`	Environment keys
`database/girzock_technologies.sql`	Install dump
`application/migrations/`	Migrations 001 to 010

Rendered screens from this audit

Preloader, as rendered in Chrome at 1440 px during a slowed page load.

Homepage About section, as rendered in Chrome at 1440 px.

Appendices: All Project Documents

The appendices below reproduce every project document in full, so this report is the single complete record. Appendices A to X are current. The archive that follows keeps earlier reports for history; where they differ from the current appendices, the current ones apply.

Appendix A: Installation and Day-to-Day Use (README)

The company website and admin panel. CodeIgniter 3.1.13, PHP 8.2, MySQL or MariaDB.

- Public site: `http://localhost/girzock-website/`
- Admin panel: `http://localhost/girzock-website/admin/login`

Install on XAMPP

You need Apache and MySQL running from the XAMPP control panel, with `mod_rewrite` on (it is by default).

1. Put the project where Apache can see it

Link it from where it is, so that the private folder in step 3 stays outside `htdocs`. In a Command Prompt:

```
mklink /J "C:\xampp\htdocs\girzock-website" "E:\Girzock Technologies\girzock website\girzock-website"
```

2. Create the database

In phpMyAdmin, choose **Import** and select `database/girzock_technologies.sql`. This creates the `girzock_technologies` database, all tables and the existing website content. Or from a terminal:

```
C:\xampp\mysql\bin\mysql.exe -u root -p < database\girzock_technologies.sql
```

The file contains no user accounts or passwords. Add the full service pages, page SEO and draft articles after step 3, once `.env` is in place:

```
php index.php setup migrate
```

3. Create the private settings file

Secrets live outside the project, in a `girzock-private` folder **next to** the project folder:

```
girzock website\
  girzock-website\      the project
  girzock-private\      secrets, resumes, sessions and logs (never publish this)
    .env
```

Copy `docs/env.example` to `girzock-private/.env` and fill it in. Generate each of the two keys with:

```
php -r "echo bin2hex(random_bytes(32)), PHP_EOL;"
```

Then copy `docs/private-dir.htaccess` to `girzock-private/.htaccess`. It blocks browsers as a second layer of protection.

If the folder has to be somewhere else, set a server environment variable `GIRZOCK_PRIVATE_DIR` to its full path, for example `SetEnv GIRZOCK_PRIVATE_DIR "/home/account/girzock-private"` in the Apache configuration. It must stay outside the public web root.

The site checks these settings on every request. If `.env` is missing, or a required production setting is absent, visitors see a plain "temporarily unavailable" page and the reason goes to `girzock-private/logs/`. A missing or invalid `SECRET_BOX_KEY` is logged too, but the site keeps running and enquiries are still saved. Emails then wait, marked Failed, until the key is fixed.

Do not change `SECRET_BOX_KEY` once it is in use: the saved SMTP password can only be read with the key that encrypted it. If the key does change, enter the SMTP password again in Website Settings.

XAMPP's default MySQL user is `root` with an empty password. Do not assume production uses the same values.

4. Create the first administrator

From the project folder:

```
php index.php setup admin girzock2026 you@example.com
```

This prints a random one-time password, once. Sign in with it; you must choose your own password before anything else opens. The command refuses to run if a Super Admin already exists. Save the email address carefully, because password reset links are sent there.

5. Configure email

Sign in and open **Website Settings > Email (SMTP)**. Enter your provider's details, save, and press **Send test email**. Alternatively, set the `SMTP_*` values in `.env`.

Until SMTP is configured, enquiries are still saved and appear in the admin panel, but no emails go out. Their email status shows as Skipped, and **Retry undelivered emails** on the enquiry page sends them afterwards.

For Gmail, turn on 2-step verification and create an App Password. Use host `smtp.gmail.com`, port `587`, encryption TLS, with the Gmail address as both username and From email.

6. Check it

Open the site, send a test enquiry from the homepage, and confirm it appears under **Enquiries** in the admin panel.

Day-to-day use

To change	Go to
Enquiries: status, notes, assignment, CSV export	Enquiries
Services, including where each appears in the menu, footer and homepage	Services > Edit > "Where this appears on the website"
Products, portfolio, case studies, careers	Their own menu items
Articles, scheduling, tags	Blog Management
Category and tag names	Categories
Company details, logo, social links, analytics	Website Settings
Page titles and descriptions, redirects	SEO Management
Admin accounts and what each role can do	Admin Users, then Roles and permissions

Text written into page layouts (such as the homepage hero, FAQ, process steps and the About page) is in the view files under `application/views/frontend/`, not the admin panel.

Scheduled blog posts go live on their own at the chosen time, with no cron job.

Going live

Nothing is deployed without the owner's approval. Full background, test results and checklists are in `docs/project-report/GIRZOCK_Technologies_Complete_Project_Report.pdf` (the same content as the `.docx`).

The deployment package lives in `deployment/` beside this folder, with `SHA256SUMS.txt`. It holds the site files without `.git`, `docs`, local tools or `.env`, plus `env.production.example`.

1. **Back up the live site first:** download its files and export its database. This is the rollback.
2. **Database:** create the database and a dedicated user with rights to it only. Export the local database (it holds the current content, at migration 16) and import it. Delete any test enquiries in the admin first if you do not want them live.
3. **Private settings:** create `girzock-private/.env` **above** the web root, from `env.production.example`: – `APP_ENV=production`; – `BASE_URL=https://girzock.com/` and `PUBLIC_URL=https://girzock.com`; – `COOKIE_SECURE=1`; – the new database credentials; – copy `ENCRYPTION_KEY` and `SECRET_BOX_KEY` **exactly** from the local `.env`. A different `SECRET_BOX_KEY` makes the stored SMTP password unreadable.

Copy `docs/private-dir.htaccess` to `girzock-private/.htaccess`. If the project sits inside `public_html`, set `GIRZOCK_PRIVATE_DIR`. Then confirm that `https://girzock.com/girzock-private/.env` does not open.

1. **Files:** check `SHA256SUMS.txt`, then upload and unpack the package into the web root. Make `assets/uploads` and the private `logs`, `sessions` and `resumes` folders writable by the web server, and nothing else.
2. **Protection:** `/.env`, `/application/config/database.php` and `/database/girzock_technologies.sql` must return 403, and `/admin` must redirect to the login.
3. **HTTPS:** once the certificate works, uncomment the HTTPS and `www` redirects at the top of `.htaccess`. Then sign in to the admin again, because cookies are now Secure.
4. **Email:** rotate the Gmail App Password, enter it in Website Settings, and use "Send test email". Then send one enquiry through the popup: – the success message should appear in under a second; – the enquiry's email log should show both emails sent.
5. **Cron:** run `php index.php setup retry_emails` every 15 minutes. It retries failed or interrupted notification emails.
6. **Compression:** confirm that CSS and JavaScript responses carry `Content-Encoding: gzip` or `br`. This is the largest speed gain.
7. **Smoke test:** – every URL in `/sitemap.xml` returns 200, with `https://girzock.com/` addresses; – the admin modules open; – the popup works; – the four footer social icons open in a new tab. Open the Facebook link once to confirm it is the right page; – the legal pages, favicon and fonts load.
8. **Search engines:** the Search Console verification tag is already in the homepage head (Website Settings). Verify the property, submit `https://girzock.com/sitemap.xml`, and run the Rich Results Test.
9. **Watch** `girzock-private/logs` for 48 hours.

Rollback: restore the files and database downloaded in step 1, and keep the old `.env` until the new site is confirmed. Migrations do not revert content, so a database rollback always means restoring a backup.

Admin password recovery: the login card no longer shows a "Forgot your password?" link. Recovery still works at `/admin/forgot-password`, so bookmark it.

Search engines and analytics

Publishing draft articles: open **Blog Management**, review the draft, use **Preview page** and set its status to Published. It then joins the sitemap automatically. Check each article's facts first.

Google Search Console:

1. At `https://search.google.com/search-console`, add `https://girzock.com` as a property.
2. For the HTML tag method, copy only the code from `content="..."` into **Website Settings > Google Search Console verification code**.
3. After verifying, submit `https://girzock.com/sitemap.xml`.
4. Use URL Inspection on the homepage and main service pages to request indexing.

Google Analytics 4: create a GA4 property and paste its Measurement ID (`G-XXXXXXXXXX`) into **Website Settings > Google Analytics ID**. Nothing loads until an ID is entered.

Google Business Profile: claim one profile for the real Thisaiyanvilai location at `https://business.google.com`, with service areas if appropriate. Do not add addresses in other towns.

After launch, check: the Rich Results Test (`https://search.google.com/test/rich-results`), and PageSpeed Insights (`https://pagespeed.web.dev`) for Core Web Vitals.

Speed on the server: turn on `mod_deflate` for text compression. In XAMPP, remove the `#` before `LoadModule deflate_module` in `httpd.conf` and restart Apache. `.htaccess` already has the rules.

Illustrations: the service, article and case study artwork and the industry icons are drawn by `database/tools/build_illustrations.js`. Edit a scene there and re-run it with `NODE_PATH=<folder with puppeteer-core> node database/tools/build_illustrations.js`.

Uploaded images: every admin upload is stored as WebP with smaller copies beside it. If the server cannot convert a file, the upload is refused with a message. It needs Imagick or GD with WebP support.

Editing CSS or JavaScript: the site loads `.min` files. After editing `style.css`, `girzock.css`, `girzock-dynamic.css`, `main.js` or `girzock.js`, rebuild them with `database/tools/minify_assets.js`. After adding large images, run `php database/tools/build_webp.php`.

Version control

Start the Git repository inside the `girzock-website` folder:

```
cd "E:\Girzock Technologies\girzock website\girzock-website"
git init
```

Never run `git init` in the parent `girzock website` folder. `.gitignore` here cannot protect `girzock-private` and `backups` from a repository started there. Before the first commit, check the list from `git add -n .` for anything private.

Database changes

`database/girzock_technologies.sql` is the complete install file. For later changes:

1. Add `application/migrations/002_describe_the_change.php`, with `up()` and `down()` methods.
2. Raise `$config['migration_version']` in `application/config/migration.php`.
3. Run `php index.php setup migrate`.

To regenerate the install file after editing `database/schema.sql`:

```
php database\tools\build_install_sql.php "path\to\original\static\html"
```

Code layout

```
application/
  controllers/          public pages; admin/ holds the admin panel
  core/                 MY_Controller, Admin_Controller, Admin_Crud_Controller (shared
list/edit/delete), MY_Model
  libraries/            Admin_auth, Mailer, Media_manager, Html_sanitizer, Seo
  models/               all database access
  views/frontend/       the public site; partials/ holds the header, footer and forms
  views/admin/          the admin panel; crud/ holds the shared list and form
assets/                 original site assets, plus admin/ and uploads/
database/               install SQL, schema and the seed builder
```

The six content modules in the admin panel declare their fields in their controllers and share one implementation in `Admin_Crud_Controller`.

`system/` is CodeIgniter itself and is unmodified. PHP 8.2 reports deprecation notices for CodeIgniter 3's dynamic properties; those notices are switched off in `index.php`. They do not affect behaviour on PHP 8.x.

Troubleshooting

Symptom	Likely cause
Every page but the home page gives 404	`mod_rewrite` is off, or `AllowOverride` is not `All` for this folder
"Temporarily unavailable" on every page	A configuration problem. The exact reason is in `girzock-private/logs/`; if there is no log there, check the PHP or Apache error log
Emails show Failed with "cannot be decrypted"	`SECRET_BOX_KEY` is missing, invalid or has changed. Restore it, or enter the SMTP password again in Website Settings
"Unable to connect to your database server"	Wrong `DB_*` values in `.env`, or `.env` not found in `girzock-private`
"The action you have requested is not allowed"	The form's security token expired. Reload the page and resubmit
Emails show Failed	Check the reason on the enquiry page, then the SMTP settings. Press **Send test email** to retry
Admin locked out after failed logins	Wait 15 minutes, or use **Forgot your password?**
Images fail to upload	`assets/uploads` is not writable, or the file is over 5 MB

Appendix B: Cleanup Record: Deleted and Kept Images

Date: 8 November 2026

How images were checked

An image was deleted only when **every** test below found nothing:

1. Its file name appears in no PHP, CSS, JavaScript, JSON, XML, HTML, SQL, plain text or `.htaccess` file in the project.
2. Its file name appears in no text column of any database table: content, settings, media library, SEO, popup and all others.
3. Its name **without the extension** appears nowhere, so paths built as `$name.'.png'` are caught.
4. Its **name family** (for example `language` for `language12.png`) is not built dynamically anywhere, for example `'language'.$i`.
5. Its **folder** is not used in a dynamically built path.
6. It was **never requested** when all 89 public pages and 2 extra pages were loaded in Chrome at desktop and phone size and in dark mode. Each page was scrolled to the end so lazy, slider and background images loaded, the menus were opened, and the popup was left to open.

If any test found anything, the image was kept. After the deletion, all 89 pages were loaded again at desktop and phone size: no local file failed to load.

Uploaded media (`assets/uploads`), favicons in use, logos in use, the hero and sharing images, and the video were all kept. The database was not changed.

Totals

Result	Files
Kept: referenced by file name	779
Kept: its name family "bg" is built dynamically in code	2
Deleted (no reference, never loaded)	77
Kept: name referenced without extension (may be built in code)	14
Kept: its name family "phone" is built dynamically in code	1
Kept: its name family "favicon" is built dynamically in code	2
Images checked	875

Deleted: 77 files, 2.90 MB.

Deleted images

They are recoverable from the code backup `backups/before-cleanup-2026-11-08/project-code.tar.gz`.

#	File	Size	Reason
1	`assets/images/event/avatar-1.png`	10 KB	No reference in code, files or database; never loaded on any page
2	`assets/images/event/avatar-1.png.webp`	1 KB	No reference in code, files or database; never loaded on any page
3	`assets/images/event/avatar-2.png`	10 KB	No reference in code, files or database; never loaded on any page
4	`assets/images/event/avatar-2.png.webp`	1 KB	No reference in code, files or database; never loaded on any page
5	`assets/images/event/choose.png`	235 KB	No reference in code, files or database; never loaded on any page
6	`assets/images/event/choose.png.webp`	47 KB	No reference in code, files or database; never loaded on any page
7	`assets/images/event/choose2.png`	263 KB	No reference in code, files or database; never loaded on any page

Kept because of doubt

These were not referenced by their exact file name, but at least one stricter test found a possible use, so they were kept.

#	File	Reason kept
1	assets/images/bg/bg2-1.png	its name family "bg" is built dynamically in code
2	assets/images/bg/bg2-1.png.webp	its name family "bg" is built dynamically in code

Kept because they are used

Each file below is referenced by its file name in the code, templates, styles, scripts or database. 174 of them were also seen loading on the public pages. The rest are used by the admin, emails, other screen sizes, other states or the install files.

Other files

Item	Decision
Exact duplicate template layer images (for example `layers/corner1-1.png` and `corner1-2.png`)	**Kept.** Each copy is referenced by its own name in the approved CSS; merging them would mean editing the styles
CodeIgniter `index.html` stubs in application folders	**Kept.** They stop folder listings
`girzock-hero.png`, `girzock-logo.png` at the site root	**Kept.** Sharing image and logo at their existing public addresses
Temporary or test files in the project	None found
Old deployment packages	**Kept, waiting for your approval.** They contain database export files
Markdown reports in `docs/`	**Kept, waiting for your approval.** Every one is reproduced as an appendix in this report
Database, `.env`, private folder, uploads, backups	Not touched

Appendix C: Final Production Readiness Report

Date: 7 November 2026 **Build:** the local copy at `E:\Girzock Technologies\girzock website\girzock-website` (database migration 16) **Target:** `https://girzock.com`

> **Status: ready to deploy, not yet live.** • The final regression passed: 9,372 checks passed. The 11 failures are a known Firefox measuring quirk, with no functional failure. • The site becomes production-ready only after the deployment steps are done on the live server and the smoke test passes. • **Nothing has been deployed. Deployment waits for your explicit approval.**

1. Acceptance criteria

#	Criterion	Status	Evidence
1	All public pages inventoried	Done	87 unique pages (61 indexable), 89 URLs including pagination, 8 templates with their records, 40 admin screens listed separately. `FULL_WEBSITE_PAGE_INVENTORY.md`
2	Unique, relevant metadata on every indexable page	Done	0 duplicate titles or descriptions; titles 30 to 60 characters; descriptions 120 to 160; one H1 each; self canonical; Open Graph and X tags; homepage-only values only on the homepage
3	Competitor research from real results	Done	6 searches and 3 competitor sites opened, with sources linked. Limit: a US-based search tool. `COMPETITOR_RESEARCH_REPORT.md`
4	Original, useful content	Done	Products and job roles rewritten; services and posts measured as complete and original; nothing copied from competitors. `SEO_CONTENT_OPTIMIZATION_REPORT.md`
5	Local SEO on the real base and genuine areas	Done in the site. Google Business Profile, street address and PIN still needed from you	One base, Thisaiyanvilai; areas served in the structured data; no town doorway pages. `LOCAL_SEO_STRATEGY.md`
6	Blog publishing updates metadata and sitemap	Done	Drafts are 404 and out of the sitemap; previews are noindex; published posts enter the sitemap with lastmod. Tested on the isolated copy
7	Professional GIRZOCK admin login	Done	`ADMIN_LOGIN_REDESIGN_REPORT.md`, screenshots in `docs/screenshots/`
8	Password eye toggle	Done	Mouse, tap, Enter and Space, in three browsers; a focus bug was found and fixed
9	Password managers without unsafe storage	Done	Standard `autocomplete` values. No password in cookies, browser storage or the page (tested). Save prompts depend on browser settings: check once by hand
10	Forgot link hidden, recovery kept	Done	Not on the card; `/admin/forgot-password` works
11	All four social links work	Done	990 real-site checks. **Facebook needs a one-time check in your browser**
12	Exact tagline on every page	Done	Only "Technology. Growth. Elevate." exists in the code and database. Checked on 23 page types
13	Same approved footer everywhere	Done	One component on every page
14	Public design unchanged	Done	Homepage comparison: no image or layout change, apart from the 320 px icon-row fix
15	Full regression and reports	Done	`FINAL_TESTING_REPORT.md` and the documents below
16	Deployment prepared, not executed	Done	Package and steps ready; waiting for your approval

2. Production preparation checks

Check	Local result	On the live server
Fresh database backup	Taken after migration 016. See section 5	Back up the live site first (step 1)

Check	Local result	On the live server
Full source backup	Taken. See section 5	—
Migrations	Version 16 locally and in the config; a fresh install reaches 16, and a second run changes nothing	Comes with the import
Production environment	`.env` has every key; values not printed. Locally `APP_ENV=development`, `COOKIE_SECURE=0`	Use `env.production.example`: `APP_ENV=production`, `https://girzock.com` base and public URL, `COOKIE_SECURE=1`, a dedicated database user, and **the same** `ENCRYPTION_KEY` and `SECRET_BOX_KEY`
HTTPS and secure cookies	Redirect rules ready but commented out. Admin cookie HttpOnly and SameSite=Lax; Secure once `COOKIE_SECURE=1`	Uncomment the rules after the certificate works; check the `http` and `www` redirects
SMTP	Sign-in verified earlier (AUTH 235, no message sent). Your two popup enquiries were delivered through the real account	Rotate the Gmail App Password; Send test email; one real enquiry
Database connection	The local site and every test run worked	Check the dedicated user in the import step
Private directories	`.env`, config, SQL, `.git`, `docs`, `system` and logs return 403; `girzock-private` is outside the web root	Repeat the checks
Uploads	`assets/uploads` is writable; scripts, HTML and SVG are blocked there (403)	Make `assets/uploads` and the private logs, sessions and resumes writable, and nothing else
Security headers	nosniff, Referrer-Policy, Permissions-Policy, X-Frame-Options; admin `DENY` and `no-store`; `X-Powered-By` removed	Add HSTS after HTTPS
Sitemap and robots	61 URLs, all valid; robots names the sitemap	Check that the URLs read `https://girzock.com/`
Canonical URLs	Self-referencing on all 89 pages; built from `PUBLIC_URL`	Set `PUBLIC_URL=https://girzock.com`
Admin authentication	170 checks: CSRF, new session at sign in, sign out ends the session, expiry, lockout after 5 failures, recovery	Sign in once after deployment
Search Console	Verification tag in the homepage head (from Website Settings)	Verify, then submit the sitemap
Sharing images	`girzock-hero.png` and `girzock-logo.png` copied from the current live site to the same addresses	—

3. Remaining items

Before launch:

1. Apply the production settings and HTTPS on the server.
2. Rotate the Gmail App Password, then test email on the live server.
3. Confirm the six job openings, and add qualifications, experience and closing dates.
4. Have the legal pages reviewed.
5. Turn on compression, then re-measure speed. Mobile Lighthouse is 50 to 59 locally, because there is no compression.
6. **Open the Facebook link once** and confirm it is your page.

Your decisions, at any time:

- **Google Business Profile, street address and PIN:** the largest local SEO gain.
- **Directory profiles:** IndiaMART, GoodFirms, TechBehemoths, The Manifest, Clutch.
- **Content facts:** product pricing approach; case study results, if the projects are real; claims to confirm (Digital Marketing, Mobile, SEO and CRM experience; permission for the "Work With" logos).
- **Sharing image:** a 1200×630 version of the hero image, because the current portrait one is cropped by Facebook and LinkedIn.
- **The custom software section:** look at it once in the browser. It is 25 to 52 px shorter than in an earlier capture, with no code change found.
- **Git:** nothing is committed unless you ask.

Minor, not blockers:

- one heading level skip on `/services`;
- 22 SVG icons without size attributes;

- 5 images not lazy-loaded;
- no CSP yet.

4. Database changes on the local database (none on the live server)

Migration	Change	Backup right before it
011	Popup settings	Yes
012	Content and local SEO (posts, service paragraphs)	Yes
013	Popup reappearance settings	No: 012 dump plus migrations rebuilds it
014	`secondary_keywords` column; homepage keyword and X settings; Search Console code (only if empty); homepage sharing values (only if empty)	Yes
015	Product descriptions (only the short originals); job descriptions and responsibilities (only if empty)	Yes
016	Secondary keywords for 52 pages (only if empty)	Yes
Direct settings update	LinkedIn and Facebook addresses in `social_links`	Yes: the backup at the start of this pass

5. Backups, package and rollback

Backups, under `E:\Girzock Technologies\girzock website\backups\`:

Folder	Contents
`before-seo-login-2026-11-07\`	Code and database at the start of this pass, plus the database immediately before migrations 014, 015 and 016
`final-seo-login-2026-11-07\`	Database and code at the end of the SEO and login pass
`before-cleanup-2026-11-08\`	Code and database before the cleanup (the database dump is kept until you decide)
`after-cleanup-2026-11-08\`	Code only, after the cleanup, matching the package
Earlier folders	Listed in `PRODUCTION_DEPLOYMENT_GUIDE.md`

Package: `E:\Girzock Technologies\girzock website\deployment\girzock-deploy-2026-11-08\` (8 November). It holds code only, with no database export; export the database at deployment time. The older package folders are out of date and are kept only until you approve their removal.

Changes made on the local site since the report (by you, not by the build):

- the homepage SEO title (83 characters) and description (226 characters);
- an explicit homepage canonical, `https://girzock.com/`.

Google usually shows about 60 characters of a title and 120 to 160 of a description, so the ends may be cut off. One job application (GZ-JOB-2026-00002) was also received through the local site.

Rollback:

1. Restore the live site's files and database, downloaded in step 1 of the guide.
2. Keep the old `.env` until the new site is confirmed.

Migrations do not revert content, so a database rollback always means restoring a backup.

6. Deployment steps

Follow `PRODUCTION_DEPLOYMENT_GUIDE.md`, steps 1 to 13. Each step happens only after your approval.

Appendix D: Production Deployment Guide

For deploying the build of 7 November 2026 to `https://girzock.com`. **Nothing has been deployed. Do these steps only after you approve.**

Package (already built)

Folder: `E:\Girzock Technologies\girzock website\deployment\girzock-deploy-2026-11-08\` (built 8 November, 10:17). This is the only current package. The older package folders are out of date and are kept only until you approve their removal.

File	Contents
`girzock-website-files.tar.gz`	1,409 site files. No `.git`, `.claude`, `docs`, local tools or `.env`. It includes the install file `database/girzock_technologies.sql` (empty schema and starter content), not your live data
(no database export)	By your instruction the package holds no database copy. Export the local database at deployment time (step 2), after deleting any test enquiries or applications you do not want live
`private-dir.htaccess`	Copy to `girzock-private/.htaccess`
`env.production.example`	Production values for `APP_ENV`, `BASE_URL`, `PUBLIC_URL`, `COOKIE_SECURE`, and `DB_USER=girzock_app` as a placeholder for your dedicated user; secret fields empty
`SHA256SUMS.txt`	Checksums to confirm the upload is complete

Local backups made today, in `backups\`: `before-popup-2026-11-07\` (code and database), `before-final-refinement-2026-11-07\` (including the database immediately before migration 012), `before-form-speed-popup-dismissal-2026-11-07.tar.gz` (code only) `after-migration-013-2026-11-07\` (the database at 17:19) `final-2026-11-07\` (19:01), `before-seo-login-2026-11-07\` (start of the SEO and login pass, with dumps right before migrations 014, 015 and 016) and `final-seo-login-2026-11-07\` (database and code at 23:04; its database matches the package, and its code archive also holds 12 tiny test images that were removed before the package was built).

No separate database dump was taken between migrations 012 and 013. Migration 013 only adds four popup settings with `INSERT IGNORE`, and nothing else changed in between. Restoring the 16:50 dump and running the migrations rebuilds the same state.

Server requirements

- **PHP:** 8.2 (tested), with mysqli, mbstring, fileinfo, dom, openssl, and gd with WebP support.
- **Database:** MariaDB 10.4 (tested) or MySQL.
- **Apache:** `mod_rewrite` (required); `mod_headers` and `mod_deflate` (recommended); `AllowOverride All`.
- **Private folder:** `girzock-private` one level above the web root, holding `.env`, `logs`, `sessions` and `resumes`, all writable.
- **Writable folder:** `assets/uploads`.

Steps

1. **Back up the live site:** download its files and export its database, before changing anything.
2. **Database:** create the database and a dedicated user with rights to it only. Import `girzock_technologies.sql`.
3. **Private settings:** create `girzock-private/.env` from `env.production.example`. – Fill in the database values. – Copy `ENCRYPTION_KEY` and **`SECRET_BOX_KEY` exactly from your local `.env`**. Otherwise the stored SMTP password cannot be read. – Never put `.env` in the web root.
4. **Files:** upload and unpack `girzock-website-files.tar.gz` into the web root. Check `SHA256SUMS.txt` first.
5. **Confirm protection:** `/.env`, `/application/config/database.php` and `/database/girzock_technologies.sql` must return 403, and `/admin` must redirect to the login.

6. **HTTPS:** with a valid certificate, uncomment the four rules at the top of `.htaccess`. Then test `http://` and `www.`, which must both redirect to `https://girzock.com/`.
7. **Secure cookies:** keep `COOKIE_SECURE=1`, then sign in to the admin panel again.
8. **Email:** rotate the Gmail App Password, enter it in Admin > Website Settings, and click "Send test email". Then send one enquiry through the popup and confirm both emails arrive. – The success message should appear in under a second. The site replies before sending the emails. – If the message takes as long as the emails, the host is holding the reply back, usually through output buffering or compression on PHP responses. Ask the host to turn this off for PHP, or tell me and I will adjust it. – Check **Admin > Enquiries > (the enquiry) > Email log** shows both emails as sent.
9. **Scheduled task:** add a cron job running `php index.php setup retry_emails` every 15 minutes.
10. **Smoke test:** – every URL in `/sitemap.xml` returns 200; – the admin modules open; – the popup opens after 5 s on desktop and mobile; after you close it, it stays hidden on refresh; – the favicon, preloader, fonts (`/assets/fonts/manrope-latin.woff2`) and legal pages work; – the footer Instagram and WhatsApp icons open in a new tab; – `robots.txt` names `https://girzock.com/sitemap.xml`.
11. **Compression:** check that CSS and JavaScript responses show `Content-Encoding`. Then rerun Lighthouse.
12. **Search engines:** add the site in Google Search Console and Bing Webmaster Tools, then submit the sitemap. The Settings field `gsc_verification` can hold Google's verification tag.
13. **Monitor:** watch `girzock-private/logs` for 48 hours.

Rollback

1. Restore the files and database you downloaded in step 1.
2. If the database has been changed since, restore its export; migration `down()` methods do not revert content.
3. Keep the old `.env` until the new site is confirmed.

Before you approve

- **Legal pages:** review the Privacy, Terms and Cookie text, ideally with a lawyer.
- **Popup:** set an end date for the Diwali offer.
- **Job openings:** confirm the six openings are genuine, or disable them.
- **After your own testing:** use Admin > Promotional Popup > **Reset visitor dismissals** only if you want every visitor to see the popup again.
- **Local business details:** send the street address and PIN code if you want them in the search markup.
- **Facebook link:** open https://www.facebook.com/profile.php?id=61596044820156 once in your browser and confirm it is your page. It could not be checked automatically. LinkedIn was confirmed.
- **Admin password recovery:** the "Forgot your password?" link is no longer shown on the login card. Bookmark `https://girzock.com/admin/forgot-password` for administrators.

Appendix E: Final Testing Report

Date: 7 November 2026 **Build:** the local copy, after the SEO, login redesign, social link and content work (database migration 16) **Live site:** nothing ran against `https://girzock.com`, and nothing has been deployed

Result

	Passed	Failed
Isolated test copy	3,249	0
Real local site, read-only	6,123	11
Total	**9,372**	**11**

The 11 failures are all the same Firefox measurement: the "Technologies to ABOUT" gap. Firefox reports 0 height for text inside an SVG mask, so the test reads 49 to 91 px. A pixel measurement found 24 to 33 px, within the target. The same check passes in Chromium and WebKit. No functional failure remains.

Not in the totals:

- the fresh-install checks (install SQL migrates to version 16; a second run changes nothing);
- 5 timed form submissions (median 46 ms; all saved; both emails sent);
- the heading-style comparison (1,176 headings, 0 differences).

How the tests were kept safe:

- **Isolated copy:**
- – its own database (`girzock_test`), server (port 8096), private folder and test keys;
- – a local mail catcher on port 2525;
- – a test admin password.
- – Every form submission, sign-in, upload and settings change happened there.
- **Real local site:** GET requests only.

Real data before and after, unchanged:

- 2 enquiries (your own); 0 applications; 1 admin account;
- the same admin, SMTP and `.env` checksums;
- no PHP errors logged today;
- 12 test uploads removed from the test copy; no test ports left open.

Isolated copy

Suite	Covers	Passed	Failed
Final content	Text, links and structure of content pages	812	0
Public site	Pages, forms, CSRF, honeypot, duplicates, emails, escaping	107	0
Admin	Sign in, lockout, password reset, roles, CRUD, enquiries, resend	291	0
SEO and delete	89-URL crawl, metadata, schema, sitemap, drafts, preview, delete	183	0
Browser	Homepage behaviour, enquiry form, gallery, mobile, search	53	0
Uploads	Image checks, conversion, limits, scripts blocked	77	0
Forms and email	All four enquiry forms, both emails, failures logged	108	0
Mega menu	All widths	234	0
Dropdown	Service dropdown, three browsers, keyboard and touch	202	0
Favicon	Favicon priority	22	0
Popup admin	Settings, validation, images, reset, migration re-run	149	0
Popup in the browser	Reappearance rules, layout at 6 laptop sizes, form, toast	438	0
Email retry	Cut-off sends retried; sent emails never repeated	6	0

Suite	Covers	Passed	Failed
Social links admin	Four URL fields, address checks, settings untouched	90	0
Social links appearance	Four icons alike, three browsers, four sizes	307	0
Admin login (new)	Redesign, eye toggle, validation, CSRF, session, sign out, expiry, rate limit, recovery, three browsers at desktop, tablet and phone size	**170**	**0**

After migration 016, a fresh install at version 16 passed the public (107), admin (291), SEO (183) and popup admin (149) suites again.

Real local site, read-only

Suite	Covers	Passed	Failed
Footer social links	23 page types, three browsers, desktop, tablet and phone, four icons, real clicks	990	0
Final content	As above, on the real data	812	0
SEO	Metadata and schema on every page	141	0
Contact panel		10	0
Mega menu		234	0
Where We Work orbit		113	0
Tabs		766	0
Effects	Outline text and header button, three browsers	378	0
About and footer text	Outline text position	1,281	11
Preloader, About, icons		762	0
WhatsApp button		438	0
Form fields	48 fields readable, 0 too faint	48	0
Real popup	Live popup settings	150	0

Two further read-only checks:

- **Crawl:** 89 URLs, all HTTP 200, 0 duplicate titles or descriptions, 0 broken links.
- **Lighthouse:** see `TECHNICAL_SEO_REPORT.md`.

Problems found during testing, and what was done

Found	Cause	Action
Eye toggle: Enter, then Space, typed a space into the password (login test)	**Real fault in the new script:** it moved focus into the field after toggling	Fixed. Focus stays on the button. All 170 login checks pass
Footer: the fourth social icon wrapped to a second line at 320 px	**Real layout issue:** four icons need 212 px; the column is 196 px	Fixed for screens under 360 px only (40 px icons, 8 px gaps). Wider screens unchanged
Login loading-state check could not read the page	**Test method:** the page had already navigated	The state is now recorded at the moment of sending. Passes
Retry test counted 2 emails	**Test assumption:** earlier suites leave failed emails that the job also retries, correctly	The test now counts only its own customer's email. Passes
Popup admin migration check expected version 13	**Test fixed to a number**	Now reads the version from the config. Passes
Admin suite failures when run without the public suite	**Test order:** the admin suite uses enquiries the public suite creates	Rerun in order: 0 failures

Homepage comparison

The homepage was compared section by section, at all widths in light and dark mode, with the 18:48 capture taken before this pass's SEO work. Results: 352 sections compared, 0 images changed, 0 console errors or failed requests.

The only height change was the footer at 320 px (+56 px), caused by the icon wrap now fixed. The hero text compared as different, but the words are identical; the difference is the counter animation. The approved homepage design is unchanged.

Not tested

- **Anything on the live server:** HTTPS, compression, production email and the production headers.
- **The Facebook profile:** it blocks automated checks.
- **Password manager save prompts:** these depend on each browser's settings. The form uses the standard attributes they look for.
- **Real iPhone and Android devices:** WebKit and Chromium device emulation stood in.
- **Google's Rich Results Test and Search Console:** they need the public site.

Appendix F: Complete SEO Audit Report

Date: 7 November 2026 **Site:** the local build of `https://girzock.com`. Crawl of 89 public URLs, read-only database checks, and Lighthouse on 11 pages.

> This is an internal checklist score, not a Google ranking score. Google publishes no SEO score, and no ranking is promised. The full method for each category is in `COMPLETE_SEO_SCORE_REPORT.md`.

Summary

- **Pages:** 87 unique public pages (61 indexable, 26 noindex on purpose). Every indexable page has a unique title, a unique description, one H1, a self-referencing canonical, Open Graph and X (Twitter) tags, breadcrumbs (except the homepage) and structured data. The sitemap lists all 61 indexable pages.
- **Score:** combined (weighted) **89.1**, overall **90.3**. Before this pass: 88.1 and 89.5.
- **Strongest areas:** indexability, metadata, headings, images and alt text, and social tags all score 99.9 or 100.
- **Weakest areas:** page speed (56.6), because the local server has no compression; and local SEO (66.9), because the Google Business Profile, street address and PIN code are missing and only you can supply them.

Scorecard

#	Category	Score /100	Weight	Measured on
1	Crawlability and indexability	99.9	15%	site-wide checks, 89 crawled URLs
2	Titles and meta descriptions	100.0	12%	62 indexable pages
3	Heading structure	100.0	6%	62 indexable pages
4	Content depth and uniqueness	93.7	15%	62 indexable pages
5	Internal linking	90.0	10%	62 indexable pages
6	Structured data	96.0	10%	62 indexable pages
7	Images and alt text	100.0	5%	923 images on 62 indexable pages
8	Social sharing and mobile tags	100.0	5%	62 indexable pages
9	Page speed (Lighthouse mobile)	56.6	12%	11 Lighthouse runs
10	Local SEO	66.9	10%	site-wide checks
	Overall (equal weight)	**90.3**		
	Combined (weighted)	**89.1**	100%	

What changed in this pass

Change	Category affected
Homepage metadata from your reference (keywords, Open Graph and X values, hero image with size and alt, geo, author, verification code)	Social sharing, local
Extended robots line on all indexable pages	Indexability
Organization schema: root logo, description, phone format, areas served (including Sattankulam and India), LinkedIn and Facebook in `sameAs`	Structured data, local
Article markup on case studies; CollectionPage on listings	Structured data (94 → 96)
Fuller product pages (6) and job pages (6)	Content (88.2 → 93.7)
Secondary keywords for 52 pages, an admin search preview and SEO warnings	Upkeep: helps keep these scores as content changes
Footer: LinkedIn and Facebook live; four icons on one row at 320 px	Local and social signals, mobile

Findings by area

Area	Report
Technical SEO (sitemap, robots, canonical URLs, redirects, pagination, headers, caching, compression, Core Web Vitals)	`TECHNICAL_SEO_REPORT.md`
Page-by-page metadata and issues	`FULL_WEBSITE_PAGE_INVENTORY.md`
Content quality and plans for the weak pages	`CONTENT_QUALITY_AUDIT.md`
Keywords, intent, blog strategy and admin SEO tools	`SEO_CONTENT_OPTIMIZATION_REPORT.md`
Local SEO	`LOCAL_SEO_STRATEGY.md`
Competitors	`COMPETITOR_RESEARCH_REPORT.md`

Remaining issues, in order of effect

1. **Google Business Profile, street address and PIN (you).** This is the largest local gap.
2. **Compression on the live server, then speed.** LCP is 15.6 to 17.7 s locally without it.
3. **Directory profiles (you):** honest listings on 3 to 5 directories the competitors use.
4. **Job qualifications and closing dates, and product pricing approach (you).** These lift the last "Needs work" pages.
5. **Minor technical items:** sizes on 22 SVG icons, lazy loading on 5 images, one heading level skip on `/services`.
6. **After launch:** Search Console verification (the code is already in place), sitemap submission, the Rich Results Test, and a Lighthouse run on the live site.

Appendix G: SEO Scorecard and Method

Date: 7 November 2026 **Site measured:** the local build at `http://localhost/girzock-website/`. All checks used GET requests and read-only database queries.

> **These scores are an internal checklist score, not a Google ranking score.** Google publishes no SEO score. A high score means the site follows the measurable practices below, which helps search engines read it. It does not guarantee any position in search results. Rankings also depend on competition, reviews, links from other sites and time, none of which a site build can control.

Scorecard

#	Category	Score /100	Weight	Measured on
1	Crawlability and indexability	99.9	15%	site-wide checks, 89 crawled URLs
2	Titles and meta descriptions	100.0	12%	62 indexable pages
3	Heading structure	100.0	6%	62 indexable pages
4	Content depth and uniqueness	93.7	15%	62 indexable pages
5	Internal linking	90.0	10%	62 indexable pages
6	Structured data	96.0	10%	62 indexable pages
7	Images and alt text	100.0	5%	923 images on 62 indexable pages
8	Social sharing and mobile tags	100.0	5%	62 indexable pages
9	Page speed (Lighthouse mobile)	56.6	12%	11 Lighthouse runs
10	Local SEO	66.9	10%	site-wide checks
	Overall (equal weight)	**90.3**		
	Combined (weighted)	**89.1**	100%	

How the totals are worked out:

- **Overall** is the plain average of the 10 category scores.
- **Combined** weights each category by its importance, using the weights in the table, which add to 100%.
- **Why the weights:** content, indexability and speed weigh most, because without them search engines cannot find, trust or comfortably show the pages. Images and social tags weigh least.
- If a category could not be measured, the combined score is calculated over the remaining weights, and the table says so.

Lighthouse's own scores, averaged over the 11 pages tested, as a separate cross-check:

Lighthouse category	Score
Performance	57

Lighthouse category	Score
SEO	100
Accessibility	99
Best practices	99

Method and result for each category

Each page-level category is scored on all 62 indexable pages, and the category is the average. Site-wide categories use the checks listed.

Crawlability and indexability — 99.9

Method: each check scores 0 to 1 (a share where it applies to many pages); the category is the average × 100.

Check	Result
Every crawled internal URL returns 200	Pass
Every sitemap URL was reached and returns 200	Pass
Every sitemap URL is indexable	Pass
Every sitemap URL has a self-referencing canonical	Pass
Every indexable URL is in the sitemap	98.4%
Every crawled page has a canonical tag	Pass
robots.txt returns 200 and names the sitemap	Pass
Every record in the sitemap (service, product, case study, job, post) carries a lastmod date	Pass
Unknown URLs return a real 404 status	Pass
Old .html addresses redirect permanently (301)	Pass
Private files are not served (.env, .git, SQL dump, config)	Pass
Thin listing pages (tags, empty category, sample portfolio items) are noindex	Pass

Titles and meta descriptions — 100.0

Method: Title 30-60 characters = 30 points (20-29 or 61-65 = 15), unique = 20. Description 120-160 characters = 30 (70-119 or 161-170 = 15), present and unique = 20.

Heading structure — 100.0

Method: Exactly one H1 = 50, two or more H2 = 30 (one = 15), H1 not used on another page = 20.

Content depth and uniqueness — 93.7

Method: 70 points scaled by visible words against the minimum for the page type, 30 points scaled by the share of the page's own text not found on any other page (80% or more = full). Template text found on a quarter of all pages (forms, call-to-action blocks) is set aside before comparing.

Internal linking — 90.0

Method: Number of other crawled pages linking to the page: 5 or more = 100, 3-4 = 80, 2 = 50, 1 = 25, none = 0. Broken internal links are covered by category 1.

Structured data — 96.0

Method: Valid JSON-LD = 25, Organization = 15, BreadcrumbList on inner pages = 20, the type that fits the page = 40 (Service, BlogPosting, JobPosting, ContactPage, WebSite on home, WebPage on others). Listings with plain WebPage get 30 (CollectionPage would fit better). Product pages get 20 of 40: Product markup has no offers, review or rating, which Google needs for product results. Case studies get 0 of 40: no Article markup.

Images and alt text — 100.0

Method: Share of images with an alt attribute = 80, share of pages with a sharing image = 20. Empty alt on decorative images counts as correct.

Social sharing and mobile tags — 100.0

Method: Seven tags, equal points: og:title, og:description, og:image, og:type, twitter:card, viewport, html lang.

Page speed (Lighthouse mobile) — 56.6

Method: Average Lighthouse performance score, mobile settings (simulated slow 4G, 4x CPU slowdown), on the local XAMPP server, which does not compress text. Production numbers will differ.

Page	Performance	SEO	Accessibility	Best practices	FCP	LCP	CLS	TBT	Page weight
/about	59	100	96	96	6.31 s	17.19 s	0.003	79 ms	3.2 MB
/areas-we-serve	57	100	100	100	7.81 s	16.21 s	0	27 ms	2.92 MB
/blog	57	100	100	100	7.81 s	17.41 s	0	27 ms	3.24 MB
/careers/web-developer	57	100	96	100	7.81 s	16.21 s	0	22 ms	2.92 MB
/contact	57	100	100	100	7.81 s	16.89 s	0.003	78 ms	3.82 MB
/	50	100	97	93	8.56 s	17.64 s	0	301 ms	3.58 MB
/blog/how-to-plan-a-business-website-that-generates-enquiries	57	100	100	100	7.96 s	16.81 s	0	0 ms	2.99 MB
/privacy-policy	56	100	100	100	9.01 s	15.61 s	0	0 ms	2.5 MB
/products/customer-portal	56	100	100	96	8.86 s	16.36 s	0	23 ms	2.93 MB
/services/website-development	58	100	100	100	7.36 s	16.66 s	0	74 ms	2.99 MB
/services	59	100	95	100	6.31 s	17.71 s	0	84 ms	3.3 MB

Local SEO — 66.9

Method: each check scores 0 to 1 (a share where it applies to many pages); the category is the average × 100.

Check	Result
Business markup with name, phone and email on every page	Pass
Street address and postcode in the markup	Fail
Map coordinates (geo) in the markup	Fail
Areas served listed in the markup	Pass
Google Business Profile or other directory listing linked (sameAs)	Fail
Town and phone visible on every indexable page	Pass
Areas We Serve page is indexable with 500+ words	Pass
Contact page shows a map	Pass
Service pages name a local place in their own text (beyond the shared template)	Pass
Key pages name the location in the title	Pass
Blog posts on local topics (place in the title)	36.4%

Lowest-scoring pages

URL	Metadata points	Content points
`/blog/category/wordpress`	100	71.1
`/blog`	100	71.5
`/blog/category/web-development`	100	71.7
`/case-studies/taking-a-local-retailer-online`	100	72.6
`/blog/page/2`	100	72.7
`/blog/category/custom-software`	100	73.8
`/blog/category/ui-ux-design`	100	74.6
`/blog/category/digital-transformation`	100	75
`/blog/category/cloud-and-aws`	100	75.4
`/case-studies/moving-a-business-application-to-aws`	100	81.8
`/case-studies/replacing-spreadsheets-with-custom-software`	100	85.5
`/careers/cloud-engineer`	100	86.8
`/careers/internships`	100	88.4
`/careers/wordpress-developer`	100	88.6
`/careers/ui-ux-designer`	100	90

The job openings and product pages are the weakest because they are short and share most of their text with similar pages. The content audit gives the fix for each.

Lighthouse runs, page by page

Settings: mobile (simulated slow 4G, 4× CPU slowdown), on the local XAMPP server, which has no text compression.

Repeat runs: the homepage and About were each measured three times, and the table uses the middle result.

- Homepage: 31, 50 and 54 (median 50). The first run had a 1.7 s blocking time that did not recur.
- About: 60, 56 and 59 (median 59).

All runs are kept with the test files. Other pages were measured once.

Why LCP is 15 to 18 s everywhere: the local server sends CSS and JavaScript uncompressed, and the theme's main stylesheet alone is 608 KB. Lighthouse expects the live server, with compression on, to be much faster. Re-measure there before judging speed.

Issues found, by area

Area	Finding	Effect	Fix
Technical	`/blog/page/2` is indexable but not in the sitemap	None. Paginated pages need not be listed	None needed
Technical	HTTPS, HSTS and the www redirect are not active locally (rules commented out in `.htaccess`)	Needed on the live site	Deployment guide, step 6
Technical	`PUBLIC_URL` is local, so canonical URLs point to `localhost`	Correct once `PUBLIC_URL=https://girzock.com` is set	Deployment guide, step 3
On-page	13 titles over 60 characters and 16 descriptions under 70, all on noindex pages (sample portfolio items, tag pages)	None for search; these pages are not indexed	Optional
On-page	`/services` has one heading level skip: a counter uses H4 after H2	Minor, for accessibility tools	Change the counter to a styled paragraph
Content	Job openings and product pages are short and mostly template text	The weakest pages for search	`CONTENT_QUALITY_AUDIT.md` has a plan for each page
Structured data	Product markup has no offers, review or rating; case studies have no Article markup; job postings have no `validThrough`	No product or job rich results until real data exists	Add only real facts; Article markup is a small code change
Structured data	All JSON-LD on the 89 crawled pages parsed without errors. Google's Rich Results Test needs a public URL, so it was not run	—	Run it after launch
Internal linking	Product pages are linked from one page (`/products`), and case studies from two	Weaker discovery	Link each product from its matching service page
Images	923 images on indexable pages, all with an `alt` attribute. 555 empty alt values are decorative repeats. 22 distinct images have no width or height attribute (mostly SVG icons), and 5 below-the-fold images do not lazy-load	Small layout and speed cost	Add sizes to the SVG icons; lazy-load the 5
Mobile	No sideways scroll on any page at 320 to 1920 px. Viewport and language set on every page. The audit's "past the right edge" readings are the closed slide-out menu, parked off-screen inside a clipped container	None	None needed

Area	Finding	Effect	Fix
Local	No street address, PIN code, map coordinates or Google Business Profile link stored	The biggest local gap	See below

What would raise the score, in order of effect

#	Action	Category	Who
1	Add the full street address and PIN code, and map coordinates, in **Website Settings**. The markup then gains `streetAddress`, `postalCode` and `geo`. A code change is needed for the extra fields	Local SEO	You supply the address; a small code change
2	Create or claim the Google Business Profile, then add its link as a social profile	Local SEO	You
3	Write more local-topic blog posts (36% of posts have a place in the title)	Local SEO, content	You or a writer
4	Fill in the job role details, and add product details and case study results	Content	You
5	Turn on compression and caching on the live server (the local XAMPP has no `mod_deflate`) and check speed again	Speed	Hosting
6	Add Article markup to case studies, and CollectionPage to listings	Structured data	Small code change
7	After launch: verify the site in Google Search Console, submit `sitemap.xml` and check the Rich Results Test	Indexability	You

Not measured here

These need the public site:

- HTTPS and HSTS;
- real server speed;
- the Search Console index report;
- links from other sites;
- Google Business Profile status;
- the Rich Results Test.

Appendix H: Technical SEO Report

Date: 7 November 2026 **Measured on:** the local build, through a crawl of 89 URLs, 11 Lighthouse pages and read-only database checks. Production-only items are marked.

1. Results

Area	Result	Status
XML sitemap	`/sitemap.xml`: 61 URLs, all HTTP 200, all indexable, all self-canonical. Every database record carries a lastmod date. No drafts, tag pages, empty categories or noindex pages	**PASS**
robots.txt	Blocks `/admin/`, `/search`, `/contact/submit`, `/careers/apply`, and names the sitemap	**PASS**
Canonical URLs	Every one of the 89 crawled pages has one, pointing to itself. Built from `PUBLIC_URL`, so they become `https://girzock.com/...` in production	PASS (locally `localhost` until `PUBLIC_URL` is set)
Redirects	11 old addresses (10 `.html` pages and `/terms-and-conditions`) return 301 to their pages. A slug change adds a 301 automatically; a deleted record returns 410	**PASS**
Broken internal links	0 in the crawl. Editors now warn about links to detail pages that do not exist	**PASS**
Duplicate URLs and content	0 duplicate titles and 0 duplicate descriptions among indexable pages. Index pages and `?page=` variants all canonicalise	**PASS**
Pagination	Each blog, category and tag page has its own title, canonical and prev/next. `/blog/page/2` is indexable but left out of the sitemap, which is normal	**PASS**
Empty categories	Digital Marketing has no posts, so it is noindex and not in the sitemap	**PASS**
Robots meta	Indexable pages: `index, follow, max-image-preview:large, max-snippet:-1, max-video-preview:-1`. Tags, sample portfolio items, search, previews and admin: noindex	**PASS**
Structured data	Organization + ProfessionalService on every page; WebSite on home; WebPage, CollectionPage or ContactPage; BreadcrumbList; Service (16); BlogPosting (11); Article (3 case studies); JobPosting (6); Product (6). All JSON-LD on 89 pages parsed without errors	PASS. Google's Rich Results Test needs the public URL
Image alt text	923 images on indexable pages, all with an alt attribute. 555 are deliberately empty because they are decorative	**PASS**
Image dimensions	22 distinct images (mostly SVG icons) have no width or height attribute	**PARTIAL**
Lazy loading	5 below-the-fold images do not lazy-load. The homepage video loads only when it comes into view	**PARTIAL**
Image formats	53 WebP images served, all with the right type. Uploads are converted to WebP. AVIF is not produced; WebP already covers current browsers, and AVIF would mean converting approved images again	PASS (AVIF not added)
CSS and JS loading	Scripts are `defer`. Icon fonts load without blocking. Theme CSS is minified (`style.min.css` 608 KB, mostly unused rules, from the original template)	**PARTIAL**
Browser caching	CSS, JS and images: `Cache-Control: public, max-age=2592000` (30 days), with version numbers on CSS and JS	**PASS**
Compression	The local XAMPP has no `mod_deflate`. `.htaccess` is ready for gzip, including `text/javascript`. **Check `Content-Encoding` on the live server**	Production
HTTPS redirects	Rules ready in `.htaccess`, commented out until the certificate works	Production
Security headers	`X-Content-Type-Options`, `Referrer-Policy`, `Permissions-Policy`, `X-Frame-Options` (SAMEORIGIN; DENY on admin). `X-Powered-By` removed. HSTS after HTTPS. A CSP was not added, because the site uses inline scripts; test it in report-only mode first	**PARTIAL**

Area	Result	Status
Mobile usability	Viewport and language set on every page. No sideways scroll from 320 to 1920 px. The footer social icons now fit on one row at 320 px	**PASS**
Core Web Vitals	Layout shift 0.000 to 0.003 on all 11 pages. LCP 15.6 to 17.7 s locally, because there is no compression and slow mobile is simulated. Field data appears only after launch	**PARTIAL**

2. Lighthouse, mobile, local server: before and after this pass

"Before" is the run at 18:00 on 7 November; "after" is the final run. The homepage and About show the median of three runs: homepage 31, 50, 54; About 60, 56, 59. This pass did not change anything aimed at speed, so differences of a few points are normal run-to-run variation.

Page	Performance before → after	SEO	Accessibility	Best practices	LCP after	CLS after	Weight
`/`	42 → 50	100	97	93	17.6 s	0.000	3.58 MB
`/about`	59 → 59	100	96	96	17.2 s	0.003	3.20 MB
`/services`	59 → 59	100	95	100	17.7 s	0.000	3.30 MB
`/services/website-development`	60 → 58	100	100	100	16.7 s	0.000	2.99 MB
`/areas-we-serve`	60 → 57	100	100	100	16.2 s	0.000	2.92 MB
`/blog`	60 → 57	100	100	100	17.4 s	0.000	3.24 MB
a blog post	60 → 57	100	100	100	16.8 s	0.000	2.99 MB
`/contact`	57 → 57	100	100	100	16.9 s	0.003	3.82 MB
a product	57 → 56	100	100	96	16.4 s	0.000	2.93 MB
a job	57 → 57	100	96	100	16.2 s	0.000	2.92 MB
`/privacy-policy`	57 → 56	100	100	100	15.6 s	0.000	2.50 MB

Why LCP is high everywhere: the local server sends text uncompressed. Turning on gzip or Brotli on the live server is the largest single speed gain available. After that, removing unused rules from the 608 KB template stylesheet would help most, but it touches the approved design, so it needs careful visual testing.

3. Production checks (after deployment)

1. `curl -I https://girzock.com/assets/css/style.min.css` shows `Content-Encoding: gzip` or `br`.
2. `http://` and `www.` redirect to `https://girzock.com/` with a 301.
3. Sitemap and canonical URLs show `https://girzock.com/`.
4. Add HSTS (`Strict-Transport-Security`) once HTTPS is confirmed.
5. Verify the property in Search Console. The verification code is already in the site's head, from Website Settings. Then submit the sitemap.
6. Run the Rich Results Test on a service, a blog post, a job and the homepage.
7. Rerun Lighthouse on the live site.

Appendix I: SEO Content Optimisation Report

Date: 7 November 2026 **Scope:** every indexable public page, plus the admin tools used to keep SEO right when content changes

> No ranking is promised. These changes make the pages clearer to people and to search engines. Rankings also depend on competition, reviews, links from other sites and time.

1. What changed in this round

Area	Change	Where
Homepage head	Your reference metadata, applied to the homepage only: keywords list, author, `googlebot`, language, contact and telephone, geo tags, `theme-color #0A1A3F`, the Google Search Console verification code, and Open Graph and X (Twitter) title, description and image (`girzock-hero.png`, 1600×1991) with alt text and size. Robots: `index, follow, max-image-preview:large, max-snippet:-1, max-video-preview:-1`	`partials/seo.php`, `libraries/Seo.php`, migration 014
Every indexable page	The same extended robots line, `author`, geo tags, `og:image:alt`, `og:image:width` and `height` where the image is local, and `twitter:image:alt`. Titles, descriptions and canonical URLs stay page-specific; the homepage canonical and keywords appear only on the homepage	same
Organization data	Logo is now `girzock-logo.png`, the same address as on the live site. Added `description` and `image`. Telephone in international form (+916379362330). `areaServed`: Thisaiyanvilai, Tirunelveli, Sattankulam, Thoothukudi, Nagercoil, Kanniyakumari, Thiruvananthapuram, Tamil Nadu, India. `sameAs`: Instagram, LinkedIn and Facebook. WhatsApp is deliberately left out of `sameAs`, because it is a chat link, not a profile	`libraries/Seo.php`
Case studies	Article markup (headline, description, image, dates, author and publisher). No ratings, results or client names	`controllers/CaseStudies.php`
Listing pages	Services, Products, Portfolio, Case Studies, Careers, the Blog and blog categories are now typed `CollectionPage`	6 controllers
Product pages (6)	The description grew from about 30 words to about 200 words each, so each page now has 355 to 416 visible words, 88 to 93% of them its own. Sections: who it is for, what is included, how it is set up, after launch or related services. Each has 2 to 4 internal links to matching services, products or guides. No prices, timelines or clients are stated	migration 015
Job pages (6)	Description and responsibilities filled in (both were empty). Qualifications and experience are left for you, because they are facts only you can set	migration 015
Secondary keywords	New field on every editable page. Filled for 9 fixed pages, 16 services, 6 products, 6 jobs, 3 case studies and 11 published posts. They are for planning and are not published on the page	migrations 014 and 016
Legal pages	Descriptions lengthened to 140 to 152 characters (earlier pass)	`controllers/Home.php`
Tag pages	Titles "Posts Tagged …", so they never clash with a category (earlier pass)	`controllers/Blog.php`

Images used for sharing were copied from your live site without changes: `girzock-hero.png` (3.1 MB) and `girzock-logo.png`. Their URLs keep working after the new site replaces the old one.

2. Keyword map (primary keyword and search intent)

Primary keywords are the focus keywords already stored for each page. All indexable records have one. Secondary keywords are in the admin, under each page's SEO section.

Page	Primary keyword	Search intent
Homepage	software development company in Thisaiyanvilai	Find a local provider (commercial, local)
About	IT company in Thisaiyanvilai	Check the company is real (trust)
Services	web development services in Tirunelveli	Compare what is offered (commercial)

Page	Primary keyword	Search intent
Contact	contact software company Tirunelveli	Get in touch (transactional)
Areas We Serve	IT services in Tirunelveli and nearby districts	Check the area is served (local)
Products	business software products	Browse ready solutions (commercial)
Portfolio	web development portfolio	See examples (trust)
Case Studies	software case studies	See how projects run (trust)
Blog	technology blog for small business	Learn (informational)
Careers	IT jobs in Tirunelveli	Find a job (navigational)
16 service pages	One each, for example "website design company in Tirunelveli", "custom software development" (stored as "software development company in Tirunelveli") and "AWS cloud solutions"	Hire for a specific service (commercial)
6 products	One each, for example "online store platform" or "booking system for service business"	Evaluate a product (commercial)
11 posts	One each, for example "website development cost in Tamil Nadu" or "custom software vs off the shelf"	Answer a question (informational)
6 jobs	One each, for example "web developer jobs in Tirunelveli"	Apply (navigational)

The full list is in **Admin → SEO Management** (fixed pages) and in each record's SEO section.

3. Page-by-page status

The measured inventory, with titles, descriptions, H1s, canonical URLs, schema and content status for every URL, is in `FULL_WEBSITE_PAGE_INVENTORY.md`. The figures:

- 0 duplicate titles and 0 duplicate descriptions;
- 0 indexable pages without exactly one H1;
- every page self-canonical.

4. Service pages

All 16 service pages already have the sections the brief lists:

- introduction, customer problems, benefits, workflow (process), use cases (industries), FAQs and related services;
- an enquiry form, and internal links;
- a unique local paragraph each, added earlier (migration 012).

They run to 717 to 1,177 visible words. More than 80% of each page's own text appears on no other page, so the paragraphs are not shared between services.

Service list in the brief compared with the site:

Brief	Site
Website Design & Development, Custom Software, Web Application, E-commerce, WordPress, UI/UX, IT Consulting, Digital Transformation	Each has its own page
Cloud Computing, Cloud Application Development, Cloud Infrastructure	Covered by **Cloud Solutions**. One page is used instead of three near-identical ones; the secondary keywords include cloud application development and cloud infrastructure
AWS Cloud Solutions	Own page

Service pages were not rewritten in this round, because measurement showed them complete and original. Rewriting good pages would add risk without benefit.

5. Blog SEO strategy

What exists: 11 published posts (720 to 1,260 words), each with its own title, description, H1, H2 and H3 sections, internal links to services, BlogPosting markup, a canonical URL, a sitemap entry with lastmod, and image alt text. There are also 20 drafts, which are noindex and not in the sitemap.

How publishing updates SEO (tested on the isolated copy; see the test report):

- A **draft** is not public: 404 for visitors, not in the sitemap.
- A **preview** is available to a signed-in admin with `?preview=1`, and is always `noindex, nofollow`.
- A **scheduled** post goes live at its time, with no cron job needed.
- A **published** post appears in the blog list, its category, the sitemap (with lastmod) and related posts. BlogPosting markup is generated from the post.

SEO preview before publishing: every editor now shows a live Google-style result preview (title, address, description and character counts), plus a list of checks.

Next topics (from the competitor gaps and the customer questions in the brief):

Topic	Primary keyword idea	Links to
Getting a business online in Thisaiyanvilai and Sattankulam	website for shop Thisaiyanvilai	Website development, Business Website Platform
WordPress website maintenance: what a monthly plan should cover	WordPress maintenance	WordPress development, Website maintenance
Cloud computing for small businesses: what to move first	cloud for small business	Cloud solutions
AWS for a growing business: hosting, backups and costs explained	AWS hosting for small business	AWS cloud solutions
Website speed and technical SEO: a checklist for owners	website speed checklist	SEO services, Website maintenance
Online ordering for local shops: marketplace or own store?	own online store vs marketplace	E-commerce development, Online Store Platform

Write each only when it can include real experience or practical steps. A short post written to fill a keyword does more harm than good.

6. Admin SEO tools

Each editor (services, products, portfolio, case studies, careers, blog) now has:

Feature	Detail
Fields	SEO title, meta description, focus keyword, **secondary keywords (new)**, canonical URL, Open Graph title and description, social image, robots (index or noindex) and slug. The slug change automatically creates a 301 redirect
Live search preview	The title, address and description as Google would show them, with character counts. It updates as you type
Warnings	Missing SEO title; title over about 60 characters; missing description, or one outside 120 to 160 characters; title or description already used by another page; a duplicate record title, which would give two pages the same H1; a missing H1; an image without alt text; an invalid canonical URL; links in the text to this site's detail pages that do not exist
No score	Warnings say what to check. There is no SEO score, because a score would suggest a ranking promise

Website Settings → SEO defaults → Homepage only: homepage keywords, the X (Twitter) title and description, and the sharing image alt text.

SEO Management → Homepage: the homepage title, description, Open Graph values and image.

7. Not done, and why

Item	Reason
Separate town pages	They would be near-identical doorway pages, which the brief rules out. Local coverage comes from real content instead (see `LOCAL_SEO_STRATEGY.md`)
Prices, ratings and reviews in markup	None exist; inventing them is ruled out
Qualifications and experience for jobs	Owner facts
A 1200×630 sharing image	Your hero image is portrait (1600×1991), so Facebook and LinkedIn will crop it. Its quality was not reduced. A landscape version, if you make one, can replace it in SEO Management → Homepage

Appendix J: Content Quality Audit

Date: 7 November 2026 **Scope:** the 62 indexable public pages. The 27 noindex pages are listed in `COMPLETE_PAGE_INVENTORY.md`.

How pages were rated

Each page was measured, not judged by eye. Four things were counted:

1. **Visible words,** not counting the menu, footer, popup and loading screen. These are compared with a minimum for the page type:

Page type	Minimum words
Home	800
Blog post	700
Service	600
Areas We Serve	500
About, product, case study	400
Job opening	300
Listing, legal	250
Blog category	200
Contact	150

These minimums are our own working targets for pages of this kind, not a Google rule. Google does not rank by word count.

1. **Own text:** the share of the page's text, in 5-word runs, that is not found on any other page. Template text that appears on a quarter of all pages or more, such as the enquiry form and call-to-action blocks, is set aside first and reported as the **template share**.
2. **Local places named:** how many times a town or district is named in the page's own text, beyond the mentions every page shares through the template.
3. **Structure:** the number of H2 headings and the number of internal links out.

Rating	Rule
Strong	At or above the minimum words, and at least 80% own text (listings are exempt from the own-text rule, because they show excerpts of other pages)
Good	At least 75% of the minimum, and at least 60% own text
Needs work	At least 50% of the minimum
Thin	Under 50% of the minimum

Results

Rating	Pages
Strong	45
Good	11
Needs work	6
Thin	0

Page type	Strong	Good	Needs work	Thin
Home	1	0	0	0
Core page	2	1	0	0
Listing	6	0	0	0
Legal	3	0	0	0
Service	16	0	0	0
Product	1	5	0	0
Case study	0	1	2	0
Job opening	0	2	4	0
Blog post	9	2	0	0
Blog category	6	0	0	0
Blog listing page	1	0	0	0

What needs work, and what to add

Add only facts you can stand behind. Do not add invented clients, figures or reviews. Every field named below already exists in the admin, so no code change is needed.

Job openings (6 pages, 277 to 303 words: 2 Good, 4 Needs work).

- **Done in this pass:** each role now has a description and 4 to 5 responsibilities (migration 015).
- **Still short:** the shared application form and benefits text make up about 40% of each page, so own text is 58 to 61%.
- **To finish (you):** fill in Qualifications and Experience required in **Admin** → **Careers**, and a closing date for any role that has one. A closing date also adds `validThrough` to the job markup.
- **First confirm the roles are real vacancies.** Turn off any role that is not.

Product pages (6 pages, 355 to 416 words: 1 Strong, 5 Good).

- **Done in this pass:** each now explains who it is for, what is included, how it is set up and related services, with internal links (migration 015).
- **Own text:** 88 to 93%.
- **To reach Strong:** add how pricing is decided, or a starting price you will honour **(you)**, and a short FAQ.
- **Product rich results:** Google needs a real price, review or rating, so do not add markup for any of these unless the facts exist.

Case studies (3 pages, 248–317 words).

- **Problem:** the pages describe the approach but give no measured outcome.
- **Fix:** if these are real projects, add the client-approved results in **Admin** → **Case studies** → **Results**: what changed and in what time, without naming the client unless they agree.
- **If they are illustrative examples,** label them as such, as the portfolio sample concepts already are.

Blog category pages (6, at or just above 200 words).

- **Problem:** they mainly list post excerpts, which is normal. The category descriptions are only 46–61 characters.
- **Fix:** a 2–3 sentence description for each, in **Admin** → **Categories**, gives every category page its own introduction.

Pages rated Strong.

- These are the home page, all 16 services, 9 of 11 blog posts, the listings, the legal pages, Areas We Serve, About and one product.
- They meet their targets with 80% or more own text, and every service page names local places in its own text.
- No action is needed beyond keeping them accurate.

What is left on the weak pages

Items marked **(you)** are facts only you can confirm; leave them out rather than guess.

Product pages (done in this pass; owner facts left)

Each product page now explains who it is for, what is included, how it is set up and related services.

Page	Still to answer (you)
`/products/business-website-platform`	Typical setup time; who hosts it
`/products/online-store-platform`	Which payment gateways you connect; delivery charge options
`/products/business-management-software`	Whether data can be exported if a client leaves
`/products/customer-portal`	Whether customers can raise new requests themselves
`/products/booking-enquiry-system`	Whether reminders are sent, and how
`/products/cloud-hosting-care-plan`	Update and backup schedule; response time

For every product, also add how pricing is decided, or a starting price you will honour **(you)**.

Job openings (descriptions and responsibilities done; owner items left)

Page	Still to add (you)
`/careers/web-developer`	Languages and frameworks required; years of experience, or freshers welcome
`/careers/software-developer`	Languages, database skills, experience level
`/careers/wordpress-developer`	WordPress, PHP and theme skills; whether a portfolio is expected
`/careers/ui-ux-designer`	Design tools used; portfolio required
`/careers/cloud-engineer`	Cloud platforms and certifications, if any
`/careers/internships`	Who can apply (year of study, courses); paid or unpaid; duration

Add a closing date to any role that has one. It also adds `validThrough` to the job markup. Turn off any role that is not a real vacancy.

Points that need your confirmation

These are factual checks, not SEO changes:

- Claims of experience in Digital Marketing, Mobile apps, SEO and CRM software.
- The company logos in the "Work With" section: you need permission to show them.
- Alangulam is not listed under Tirunelveli District, because it has been in Tenkasi District since 2019. Add it to the Tenkasi area if you serve it.
- The legal pages are a sound starting text. Have them reviewed before launch.

Every indexable page

Appendix K: Local SEO Strategy

Date: 7 November 2026

Related documents:

- `LOCAL_SEO_CONTENT_STRATEGY.md`: the page-by-page changes made earlier;
- `COMPETITOR_RESEARCH_REPORT.md`: what local competitors do.

1. The one rule

GIRZOCK Technologies has **one place of business: Thisaiyanvilai, Tirunelveli District.** Every other town is a **service area**, reached online and by visits when needed. The website, the structured data and any directory profile must say exactly this. No branch offices, no invented street addresses, no fake listings.

2. Target places

Priority	Places	Why
Primary	**Thisaiyanvilai** (the base), **Tirunelveli** (district headquarters and the most searched place name), **Sattankulam** (neighbouring town in Thoothukudi District)	Nearest customers, and the searches competitors ignore (see the competitor report)
Districts	Tirunelveli, Thoothukudi, Kanniyakumari	The region served
Larger towns	Palayamkottai, Valliyur, Nagercoil, Thoothukudi, Tiruchendur, Kovilpatti, Marthandam	Real demand centres within reach
Nearby beyond Tamil Nadu	Thiruvananthapuram	Already named as a service area

Spelling: Google treats variants as related. The site uses the common English forms Thisaiyanvilai, Kanniyakumari or Kanyakumari, and Thoothukudi, which also appears as Tuticorin. Wikipedia spells the town "Thisayanvilai". Use one form consistently in the Google Business Profile, matching the website: **Thisaiyanvilai**.

Tenkasi: Alangulam has been in Tenkasi District since 2019. Tenkasi is not targeted, because you have not said you serve it.

3. Where place names appear on the site

Page	Use
Homepage	Title "Website & Software Development in Tirunelveli | GIRZOCK". The About paragraph names the three districts. Your meta keywords list is on this page only
About	The Thisaiyanvilai base and the region
Contact	Base, map, and the districts served
Areas We Serve	A card per district, a Sattankulam card, and the town lists. Says plainly that there is one office
16 service pages	One local paragraph each, different for every service, naming only the towns that fit
Blog	4 of 11 posts have a place in the title; others mention places only where useful
Structured data	`address`: Thisaiyanvilai, Tamil Nadu, IN. `areaServed`: Thisaiyanvilai, Tirunelveli, Sattankulam, Thoothukudi, Nagercoil, Kanniyakumari, Thiruvananthapuram, Tamil Nadu, India
Head tags	`geo.region` IN-TN; `geo.placename` Thisaiyanvilai, Tirunelveli, Tamil Nadu

Place names are not repeated in every paragraph, and there are no near-identical town pages.

4. What only you can do (largest effect first)

1. **Google Business Profile:** – Create or claim it with the exact business name, the Thisaiyanvilai address and the phone number `+91 6379362330`. – Choose a primary category such as "Software company" or "Website designer". – Set the service areas to the three districts. – Add real photos, the opening hours and the website `https://girzock.com`. – Then send me the profile link. It goes into Website Settings and the structured data (`sameAs`, plus `hasMap`).

2. **Street address and PIN code:** if you are comfortable publishing them, send them to me. The structured data then gains `streetAddress` and `postalCode`. They are not stored today, and none have been invented.
3. **Reviews:** ask real clients for reviews on the Google Business Profile. Do not copy reviews onto the website without permission, and do not add star ratings to the structured data.
4. **Directory profiles:** – Create profiles on 3 to 5 directories that competitors use: IndiaMART, GoodFirms, TechBehemoths, The Manifest, Clutch, Justdial. – Use the same name, address and phone everywhere. – These are honest citations, not bought links.
5. **LinkedIn and Facebook:** both are now linked in the footer and the structured data. Post occasional real updates. **Check that the Facebook link opens your page:** it could not be checked automatically.

5. Content plan (local)

Topic	Format	Status
Why small businesses in Tirunelveli need a professional website	Post	Published
How to choose a web development company in Tirunelveli	Post	Published
Website development cost in Tamil Nadu	Post	Published
Getting a business online in Thisaiyanvilai and Sattankulam: what to prepare	New post, written from real questions customers ask you	Suggested
Online ordering for shops in Thoothukudi and Tiruchendur	New post, only if you have done such work	Suggested
Cloud backups for offices in Nagercoil and Kanniyakumari	New post	Suggested
Local drafts already in the admin (20 drafts)	Review, expand and publish one at a time	Waiting for you

Each new post follows `BLOG_PUBLISHING_GUIDE.md`:

- its own title and description;
- one place in the title at most;
- links to the matching service page;
- an image with alt text.

6. How to measure

After launch, use Google Search Console (the verification code is already in the site's head):

- Performance → Queries, filtered by place names, shows which towns bring visits.
- Strengthen the pages behind those queries first.

In the Google Business Profile, Performance shows calls, direction requests and website clicks.

No ranking can be promised. Local results depend heavily on the Google Business Profile, reviews and distance, which a website alone cannot control.

Appendix L: Local SEO Content Changes

Date: 7 November 2026.

Principle

GIRZOCK Technologies has **one office, in Thisaiyanvilai** (Tirunelveli District). Every other place is a **service area**: projects run online, with visits when needed. The site says this plainly and never implies a branch office.

Targets

Level	Places	How they are used
Primary	Thisaiyanvilai, Tirunelveli, Sattankulam	Homepage, About, Contact, Areas We Serve, service pages, homepage meta title
Districts	Tirunelveli, Thoothukudi, Kanyakumari	Named together as the service region on the homepage, Contact and every service page
Towns, Tirunelveli District	Tirunelveli, Palayamkottai, Valliyur, Radhapuram, Nanguneri, Kalakkad, Cheranmahadevi, Ambasamudram	Areas We Serve town list; some service pages
Towns, Thoothukudi District	Sattankulam, Thoothukudi, Tiruchendur, Kovilpatti, Srivaikuntam, Ettayapuram, Vilathikulam	Areas We Serve; service pages where relevant
Towns, Kanyakumari District	Nagercoil, Kanyakumari, Marthandam, Colachel, Thuckalay, Kuzhithurai, Padmanabhapuram	Areas We Serve; service pages where relevant

Please confirm:

- **Alangulam:** the brief listed it under Tirunelveli District, but it has been part of Tenkasi district since the 2019 reorganisation, so it is not listed under Tirunelveli on the site.
- **Tenkasi:** not used, because the brief said to use it only if you genuinely serve it.

What changed on the site

Page	Change
Homepage	The About paragraph names the three districts. Meta title is now "Website & Software Development in Tirunelveli | GIRZOCK" (55 characters)
Contact	The intro names the three districts, including Sattankulam, Tiruchendur and Nagercoil, and links to Areas We Serve
Areas We Serve	New Sattankulam card. New "Towns Across Three Districts" section listing towns by district. The existing honest wording about the single office is kept
16 service pages	One new paragraph on each, different for every service, describing the local customers and towns it suits. Added by migration 012, only where the paragraph was not already present
6 blog posts	Rewritten in full. Place names are used only where they fit, not in every post

Why there are no separate city pages

The brief allowed location pages only where genuinely useful. Separate pages for each town would repeat the same service text with a different town name. Google treats such pages as doorway pages, and they would help no customer. One Areas We Serve page with real information per district, plus local paragraphs on the service pages, covers these searches honestly.

A dedicated page for one town is worth adding only when there is something specific to say: local clients who agree to be named, local projects, or a regular meeting place.

Search themes these pages now support

- Website development company in Tirunelveli: website development service and homepage.
- Web design company in Thisaiyanvilai: homepage, About, Areas We Serve.
- Software development company in Tirunelveli: custom software service and homepage.

- Website development services in Thoothukudi and Sattankulam: Areas We Serve and service pages.
- Custom software development in Nagercoil: custom software service and Areas We Serve.
- Web development services in Kanyakumari: Areas We Serve and website development.

Next steps that do not need code

1. **Google Business Profile:** create or claim it with the exact Thisaiyanvilai address and phone used on the site. Set the service areas to the three districts.
2. **Reviews:** ask real clients for Google reviews. Do not add reviews to the website without permission.
3. **Draft blog posts:** 20 drafts cover local topics (Thoothukudi, Nagercoil, Kanyakumari, Thisaiyanvilai). Review, expand and publish them one at a time; do not publish them as they are.
4. **Search Console:** after launch, watch which towns appear in search queries. Strengthen those pages first.

Appendix M: Competitor Research Report

Date: 7 November 2026

Method:

- web searches for the target phrases in the brief, on a US-based search tool (see the limits below);
- reading the result pages;
- opening three competitor websites to look at their structure.

Rules followed:

- Only companies that appeared in the results are named.
- No competitor text, branding or layout has been copied.
- Claims made by competitors about themselves are reported as their claims, not as facts.

Limits. The search tool runs from the United States, not from Tirunelveli. Google's local results and Maps listings near Thisaiyanvilai may differ. Repeat the key searches from a phone in the area, signed out of Google, before acting on rankings. No paid SEO tool was used, so there are no search volume or backlink counts here.

1. Who appears for the target searches

Search	What came up	Named firms (as listed in the results)
Software development company in Tirunelveli	Mostly directories and listing articles (Housing.com, The Manifest, IndiaMART, TraffiCtail), plus job boards	Zenvic Software Solution, Adaptive Development, Zervia Tech Solutions, Chaosology Technologies, Bravery Infotech, Consign IT, Neemtec Solutions, Guru Software Solution, Jaz Infotech, UNIQ Technologies, Vivant360, Ajax Media Tech
Web development / website design company in Tirunelveli	Company blog posts on Blogspot written to rank for the phrase, plus directories (TechBehemoths, IndiaMART, The Manifest)	Advetri Growth Ventures, Azasoft Solutions, Guru Software Solution, LogixWeb Solutions, Olympods Software Solutions, Maz Software Solutions, UNIQ Technologies, SKR Websites
Software company in Thoothukudi	Almost entirely IndiaMART profiles and job boards. TechBehemoths lists one firm	Zerosoft Technologies, Neebosh Software Solution, Tutytech, Zion Technology, Doozyinfo Software Solutions, CC Softec, V4U Tech Solutions
Web development company in Nagercoil	GoodFirms (13 listed companies), Blogspot pages, IndiaMART, LinkedIn, Clutch	Whitelake Technology Solutions, WebConcise Technologies, Praise Infotech, QDCODEX, Online J2J Software Solutions, Techsnapie Solutions, Wenoxo Technologies, Clovion Tech Solutions, CapeStart Software, Spangles Infotech
Website development in Thisaiyanvilai	**No local provider at all.** Wikipedia's page on the town, then unrelated freelancer pages	None
Custom software development Tamil Nadu (with district towns)	Directories, plus "city pages" from Patron Services that target many towns	Patron Services, Zervia, Clovion, CapeStart, Spangles, Wenoxo, Trendace

2. What the competitors do

Page structure and service coverage

Advetri (advetri.com, Tirunelveli):

- **Menu:** Home, About, Services, Blogs, Contact.
- **Services:** one combined services page. The homepage "Learn More" buttons point to #, so its individual services have no real pages.
- **Location pages:** there are state-level pages such as "web development company in Tamil Nadu".
- **Content problems:** placeholder text ("Lorem ipsum", "This is the heading") is visible on the homepage, and the statistics counters showed 0 when fetched.
- **Footer:** links to unrelated outside repositories.

Zenvic Soft (zenvicsoft.com, Tirunelveli): a plain fetch of the homepage returned only the company name. The content is drawn by JavaScript, so search engines that do not run scripts see very little.

Patron Services (patronservices.in):

- **Approach:** one page per service per town, for example "Software Development Company in Nagercoil".
- **Template:** each page has about 800 to 1,000 words with the same headings: local details, why choose us, use cases, pricing guidance, FAQs and nearby cities.
- **Repetition:** most of the text is generic, with the town name repeated, plus a line of stacked keywords.

Directory profiles: most firms in Thoothukudi and Nagercoil appear mainly through IndiaMART, GoodFirms, TechBehemoths, The Manifest and Clutch rather than through their own sites.

Keyword targeting, titles and descriptions

- **Exact match is the norm.** Titles copy the search phrase exactly ("Software Development Company in Nagercoil | …").
- **Self-written ranking posts.** Several firms rank by publishing posts on free Blogspot sites with titles such as "Web Design Companies in Tirunelveli". These posts are self-promotional lists.
- **The smallest towns are ignored.** No competitor targets Thisaiyanvilai or Sattankulam.

Content depth and originality

- Most firm websites in the results have short service text.
- The longest local pages found (Patron Services) are templated across towns.
- No competitor in the results published case material or guides specific to a district.

Local SEO approach

- **Directories:** location appears through directory listings and town names in titles.
- **Addresses:** the firms that show a street address do so in their footer and directory profiles.
- **Google Maps:** a search tool like this one cannot see Maps listings. Check them by hand.

Internal linking

- Advetri's service buttons lead nowhere (#).
- Patron Services links each town page to nearby towns and other services in the same town. This is structured, but repetitive.

Blogs

- Advetri has a blog section, but no posts were visible on its homepage.
- Azasoft and Advetri publish on separate Blogspot sites rather than on their own domains, so those posts build little authority for their main sites.

Backlinks (from public pages only)

The links these firms visibly have come from:

- business directories: IndiaMART, GoodFirms, TechBehemoths, The Manifest, Clutch, Sortlist;
- LinkedIn company pages;
- listing articles (Housing.com, TraffiCtail);
- their own Blogspot posts;
- job boards.

No measured backlink data was available.

Technical issues seen

- Content drawn only by JavaScript (Zenvic).
- Placeholder text left on a live homepage, and # links (Advetri).

- Keyword-stuffed lines on town pages (Patron Services).

3. Where GIRZOCK stands

Area	GIRZOCK today	Typical competitor
Service pages	16 separate service pages of about 720 to 1,180 words, each with problems, benefits, process, use cases, FAQs and a local paragraph	One combined page, or short pages
Location	Real base in Thisaiyanvilai, stated plainly. One Areas We Serve page that names towns in three districts without inventing offices	Town names inserted into titles; templated town pages
Blog on its own domain	11 published posts of 720 to 1,260 words, 4 of them on local topics	Posts on separate Blogspot sites, or none visible
Technical	Server-rendered pages, structured data on every page, sitemap, canonical URLs, no placeholder content	Script-only content, placeholder text and # links on some sites
Directory presence	**Not found in any directory in these results**	Most firms rely on directories
Google Business Profile	**Unknown.** None is linked from the site	Not visible to this tool

4. Opportunities, in order of likely effect

1. **Google Business Profile (you).** Create or claim it with the real Thisaiyanvilai address, the hours and the services. This is the most important single step for "near me" and Maps searches. Use exactly the same name, phone and town as the website.
2. **Honest directory profiles (you).** Most competitors are found through IndiaMART, GoodFirms, TechBehemoths, The Manifest and Clutch. Real profiles on 3 to 5 of them, with the same name, address and phone, give genuine citations and links. **Do not buy links or create fake listings.**
3. **Own the nearest towns.** Nobody targets Thisaiyanvilai or Sattankulam. The site already names them naturally (home, About, Contact, Areas We Serve, service pages). Keep doing that through real content, such as a blog post about how businesses around Thisaiyanvilai and Sattankulam can get online. **Do not** create separate near-identical town pages; that is the template pattern seen at Patron Services.
4. **Fill the content gaps competitors leave:** – practical local guides, such as "what a website costs a small business in Tamil Nadu" (already published); – questions owners ask before buying; – honest comparisons such as WordPress or custom (published).

Section 8 of `SEO_CONTENT_OPTIMIZATION_REPORT.md` lists the next topics.

1. **Real proof:** client-approved case studies with outcomes, and reviews on the Google Business Profile, once you have them. None should be invented.
2. **LinkedIn company page:** now linked from the site and from the structured data. Post occasional project updates there.

5. What not to copy

- Lists of "top companies" written by a company about itself.
- Keyword lines such as "Software Company IT Software Company".
- Town pages that differ only in the town name.
- Counters or star ratings without real data behind them.
- Placeholder text, and buttons that go nowhere.

Appendix N: Admin Login Redesign

Date: 7 November 2026 **Screens:** `/admin/login`, plus `/admin/forgot-password` and `/admin/reset-password/…`, which share the same shell **Public website:** unchanged

Design

- **Background:** full-screen navy (`#0A1A3F`) with soft electric-blue and cyan glows and a faint grid that fades out at the edges.
- **Card:** one white card with rounded corners and a deep shadow.
- – **Desktop, over 900 px:** two panels.
- – Left: the white GIRZOCK logo, which already carries "Technology. Growth. Elevate.", and the line "Manage your website content, enquiries, careers and SEO in one secure place". Two plain points: encrypted, role-based access; every change recorded.
- – Right: the form.
- – **Tablet and phone:** one column. The brand panel becomes a compact header with the logo.
- **Logo:** shown at its true 640×199 ratio, with `width` and `height` set so nothing shifts while it loads.
- **Type:** the site's own self-hosted Sora (headings) and Manrope (text).
- **Fields:** 50 px high, icons for the user and the lock, a clear blue focus ring and a red error state.
- **Button:** the site's cyan-to-blue gradient, 52 px high, with a spinner while signing in.
- **Credits:** the layout reference was used only for the idea of a split brand-and-form card. No Jovens Academy branding, logo, text or graphics were used.

Screenshots: `docs/screenshots/admin-login-desktop.png` (1440×900) and `admin-login-phone.png` (390×844).

Form behaviour

Requirement	How it works
Username or email	`autocomplete="username"`, no auto-capitalisation or spell check, max 190 characters
Password	`type="password"`, `autocomplete="current-password"`
Eye toggle	A real button inside the field. It starts hidden ("Show password", `aria-pressed="false"`). Clicking, tapping, Enter or Space switches between hidden and visible, and updates the label and icon. The typed value and caret position are kept
Password hidden again on submit	If the password is visible when the form is sent, it is switched back to hidden first, so it is never left showing and browsers save it as a password
Validation	Empty fields show a message under each field and move focus to the first one, before anything is sent. The server checks again: empty fields get "Enter your username or email and your password." and **no sign-in attempt is counted**
Wrong details	One message for both a wrong password and an unknown user ("The username or password is incorrect."), so the page never reveals whether an account exists
Loading state	The button shows a spinner and "Signing in…", is marked `aria-busy`, and ignores repeat clicks. Pressing Back clears it
Forgot password	The link is **not shown** on the login card. Recovery still works at `/admin/forgot-password`, which emails a one-hour, single-use link. The token is stored only as a hash. Bookmark that address for administrators
Password managers	A standard POST form with the right `autocomplete` values, so Chrome, Edge, Firefox and Safari offer to save and fill the password. The site itself never stores the password anywhere: no plaintext, browser storage, cookie or custom database field
Remember me	Not added. None existed before, and adding one safely needs a separate token design. Sessions last 2 hours of inactivity

Security (kept, and tested)

Control	Implementation
Password hashing	bcrypt via `password_hash`. Old hashes are upgraded on sign-in
Verification	`password_verify`, with a dummy hash for unknown users so timing gives nothing away

Control	Implementation
CSRF	Every form has a token. A missing or wrong token gets 403
Session	New session ID at sign-in. The session is tied to the current password, so a password change ends other sessions. Cookie `gz_admin_session` is HttpOnly and SameSite=Lax, and is Secure when `COOKIE_SECURE=1` in production. Expires after 2 hours
Rate limit	5 failures for one username and IP, or 20 from one IP, within 15 minutes locks sign-in (429)
Sign out	POST with a token only. The session is destroyed, and the old cookie no longer works
Headers	`noindex, nofollow`, `X-Frame-Options: DENY`, `Cache-Control: no-store`
Admin routes	Every `/admin` page redirects to the login without a session. Role permissions are unchanged
Credentials	Not changed or reset

Files

File	Change
`application/views/admin/auth/shell_top.php`	New shell: background, brand panel and form panel
`application/views/admin/auth/shell_bottom.php`	New: closes the card and loads the script
`application/views/admin/auth/login.php`	New form: icons, eye toggle, messages, loading state; no forgot link
`application/views/admin/auth/reveal.php`	New: the eye button, shared with the reset form
`application/views/admin/auth/forgot.php`, `reset.php`	Use the new shell. The reset form's two password fields get the eye toggle
`assets/admin/css/auth.css`	New: styles for the three screens only
`assets/admin/js/auth.js`	New: eye toggle, field messages and loading state. It never reads, logs or stores the password value
`application/controllers/admin/Auth.php`	Empty fields are refused before any sign-in attempt (422)

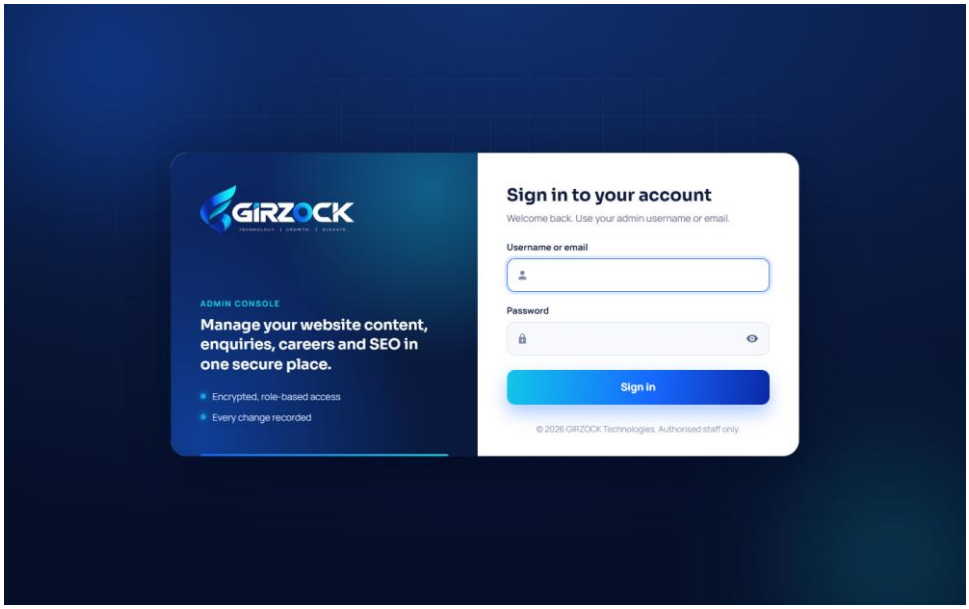

Test results

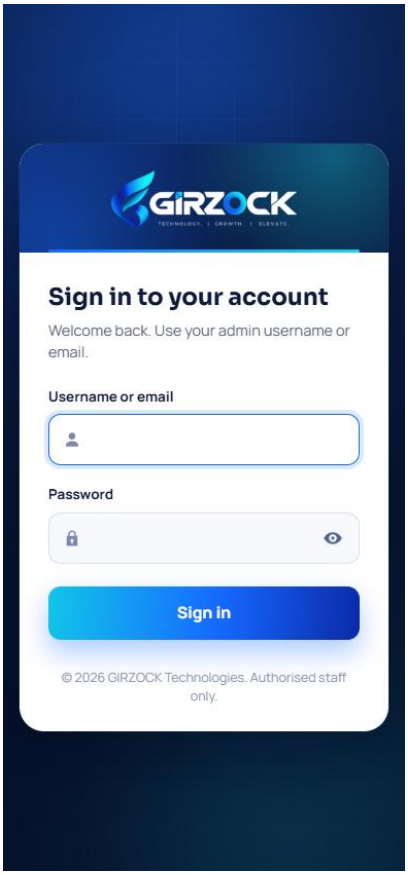

`t64_login.js`, on the isolated test copy (its own database, server and test admin password; your real credentials were never used): **170 passed, 0 failed.**

Area	What was checked
Page	200; `noindex`; cannot be framed; no forgot link; `autocomplete="username"` and `"current-password"`; CSRF token; eye toggle starts as "Show password"; logo at its true ratio
Empty fields	422 with a clear message; no sign-in attempt recorded; username kept
Wrong password, unknown user	401 with the same message for both; the typed password never appears in the page
CSRF	Missing or wrong token gets 403
Correct sign in	Redirect to the dashboard; **new session ID**; cookie HttpOnly and SameSite; no password in any cookie; recorded in the activity log
SEO tools in the admin	Secondary keywords field, search preview and warnings in the editor; homepage fields in Settings
Sign out	POST only; the session ends; **the old session cookie no longer works**
Session expiry	When the stored session is gone (as after the 2-hour timeout), the admin sends the user back to the login
Rate limit	5 wrong passwords, then **429 even with the right password**
Recovery	`/admin/forgot-password` and reset links still work
Chromium, Firefox, WebKit at 1440, 820 and 390 px	No sideways scroll; logo keeps its shape; button 44 px or taller and eye button 40 px; two panels on desktop and one column below 900 px; empty submit shows messages and focuses the first field; messages clear while typing; password hidden by default; the eye shows and hides it by mouse or tap, and **by Enter and Space**; the value is kept; signing in works; no password in browser storage; no console errors
Loading state	At the moment of sending, the button shows "Signing in…" with `aria-busy`, and the password is hidden again

Found by the test and fixed: in the first version, the eye button moved focus into the password field after toggling. A keyboard user pressing Space next would have typed a space into their password. Focus now stays on the button, which is the standard behaviour.

Not testable automatically: whether each browser's password manager actually offers to save. It depends on the browser's own settings. The form uses the standard attributes these managers look for. Check once by signing in with Chrome or Edge and accepting "Save password".

Appendix O: Footer and Social Links

Date: 7 November 2026 **Supersedes:** `FOOTER_SOCIAL_LINK_AUDIT.md`, which covers the earlier pass when only two icons were live

Social links: all four live

Platform	Address	Source	Checked
LinkedIn	https://www.linkedin.com/company/girzock-technologies/	You, in this brief	**Confirmed:** the page opens and its title is "Girzock Technologies | LinkedIn"
Facebook	https://www.facebook.com/profile.php?id=61596044820156	You, in this brief	**Not confirmed automatically.** Facebook refuses automated checks (HTTP 400 to a script). Open it once in a browser and confirm it is your page
Instagram	https://www.instagram.com/girzocktechnologies/	Already configured	Already live
WhatsApp	https://wa.me/916379362330	Already configured	Already live

How they were saved:

- The LinkedIn and Facebook addresses went into the existing **Admin → Website Settings → Social links** records, after a database backup.
- Both passed the same address check the admin form uses.
- No other social address was added or changed.

Order in the footer: LinkedIn, Facebook, Instagram, WhatsApp, using the existing icon style:

- 44 px round outline icons, with the homepage hover effect;
- 40 px with tighter spacing only on phones under 360 px wide, so all four stay on one row.

Every link has:

- `target="_blank"` and `rel="noopener noreferrer"`;
- an accessible name, for example "GIRZOCK Technologies on LinkedIn (opens in a new tab)";
- a tooltip.

Structured data: the Organization `sameAs` lists LinkedIn, Facebook and Instagram. WhatsApp is left out, because it is a chat link, not a profile.

Admin: Website Settings → Social links

Fields: LinkedIn URL, Facebook URL, Instagram URL and WhatsApp URL, each with an example address.

What is accepted:

- `https://` only;
- the platform's own domain only:
- – LinkedIn: linkedin.com and its country subdomains;
- – Facebook: facebook.com, m.facebook.com, fb.com;
- – Instagram: instagram.com;
- – WhatsApp: wa.me, api.whatsapp.com, whatsapp.com;
- a profile path, not just the home page;
- no login details or port in the address.

What is refused, with a clear message: `javascript:`, `data:`, plain `http:`, other websites and look-alike domains.

Saving: an empty field hides that icon. Saving the form leaves every other setting unchanged.

Safety net: the footer and structured data check each address again when the page is drawn, so an unsafe value that reached the database another way is never shown.

Tagline and footer

- **Tagline:** the only tagline in the code and database is **"Technology. Growth. Elevate."**, stored as the `tagline` setting. A search of all code and the full database export found no "Develop. Expand. Transform.", "Technology. Growth. Beyond." or any other variant.
- **One footer:** every public page uses the homepage footer component (`partials/footer_home.php`). Inner pages load it through `footer_inner.php`, which only closes the page wrapper first. There is no separate footer for the legal pages.

Tests

Test	Where	Coverage	Result
`t60_social.js`	Local real site, GET only	23 page types, including privacy, terms, cookies, a service, a product, a portfolio item, a case study, a post, a category, a tag, a job and the 404 page, in Chromium. Home and the legal pages in Firefox and WebKit. Desktop 1366×768, tablet 820×1180, phone 390×844. Checks the four icons in order, attributes, labels, icon size, tagline, and real clicks opening each profile in a new tab with no opener	**990 passed, 0 failed**
`t61_social_admin.php`	Isolated copy	Admin fields; 9 unsafe or wrong addresses refused; valid save; other settings untouched; icons on 20 page types; `sameAs`; unsafe stored value never drawn; emptying hides the icons	**90 passed, 0 failed**
`t62_social_visual.js`	Isolated copy	The four icons look and behave alike at 1440, 1024, 820 and 390 px in three browsers: same computed size, border, radius and hover; one row; at least 24 px touch targets; clicks near the edge open the profile	**307 passed, 0 failed**
Narrow phones	Local real site	At 320 px the fourth icon used to wrap to a second row; it now fits on one row. 360, 375 and 390 px are unchanged	Measured

In every click test, requests to LinkedIn, Facebook, Instagram and WhatsApp were answered locally by the test, so nothing was sent to those services.

Files changed in this pass

File	Change
Database `social_links` (local)	LinkedIn and Facebook addresses saved
`assets/css/girzock.css` and `girzock.min.css`	Four icons on one row under 360 px
`application/libraries/Seo.php`	`sameAs` now includes LinkedIn and Facebook (automatic, from the checked list)

The admin fields, address checks and footer markup were built in the previous pass. See `FOOTER_SOCIAL_LINK_AUDIT.md`.

Appendix P: Footer Standardisation

Date: 7 November 2026.

Before

- **Homepage:** `footer_home.php`, the dark rounded footer.
- **Every other page:** `footer_inner.php`, an older template design with a "Develop. Expand. Transform. Start with GIRZOCK" banner and "Develop. Expand. Transform." in the copyright bar.
- **About page:** "Develop. Expand. Transform." appeared three more times, in its scrolling strip.

After

- `application/views/frontend/partials/footer_home.php` is **the only footer**. It contains the logo, intro text, social icons, the animated GIRZOCK outline text, the Contacts, Company and Services columns, the copyright line and the tagline.
- `footer_inner.php` now only closes the page's main section, when the page opened one, then loads the same footer. Any future footer change made in `footer_home.php` appears on every page.
- **Copyright line:** "© GIRZOCK Technologies 2026. All rights reserved. Privacy | Terms | Cookies". The year updates automatically.
- **Tagline:** "Technology. Growth. Elevate.", from Website Settings (the stored value was already correct).
- **About strip:** now reads "Technology. Growth. Elevate."
- **Inner pages:** the footer's corners are rounded, because it stands on its own there rather than below the homepage contact section.
- **Bug fixed in passing:** the legal pages never opened the main section, so the old footer closed a section that was never open. The new footer closes it only when it is open.

Verification

A server-side check on 12 page types (home, about, a service, blog, a tag page, contact, a career, portfolio, areas, and the three legal pages) found:

- the homepage footer on every page;
- no old footer;
- no "Develop. Expand. Transform.";
- the tagline present;
- the main section opened and closed in balance.

Browser results are in `TESTING_REPORT.md`.

Appendix Q: Form Submission Performance

Date: 7 November 2026 **Forms covered:**

- the promotional popup;
- the homepage enquiry form;
- the Contact page form;
- the short message form on inner pages.

All four send to `contact/submit`. The careers application form is a normal page post with a file upload, and was not changed.

Result

	Before	After
Time until the visitor sees the reply, with a mail server that takes 3 s per email (median of 5)	**6,123 ms** (6,081 to 6,133)	**60 ms** (49 to 68) in the first run; **43 ms** (33 to 58) in the repeat run
Enquiry saved before the reply	Yes	Yes
Both emails sent	Yes, before the reply	Yes, after the reply. Checked 12 s later: `company=sent`, `client=sent`

Your own enquiries before the change: GZ-ENQ-2026-00007 and 00008, sent through the real Gmail SMTP account, took about 13 to 14 s from saving to the second email. The email log shows the enquiry saved at 16:40:16, the company email at 16:40:23 and the client email at 16:40:30. Before the change, the visitor waited for all of that.

What was slow

The server saved the enquiry, then sent the company email and the client email one after the other, and only then answered the browser. Each email to Gmail took several seconds, so the visitor waited for both.

What changed

`application/controllers/Contact.php`, `reply_now()`:

1. The enquiry is checked and **saved to the database first**, as before. If saving fails, the visitor gets an error and no success message.
2. The server then **sends the reply at once**. It sets a fixed `Content-Length` and `Connection: close`, empties PHP's output buffers and turns off compression for that one response, so nothing holds the reply back. It also calls `fastcgi_finish_request()` where the server supports it.
3. It **releases the session** (`session_write_close()`), so the visitor's next page does not wait for the emails.
4. Only then does it **send the two emails**. `ignore_user_abort` keeps them going even if the visitor closes the page. The time limit for this step is 120 s.

Requests that are not AJAX, such as a browser without JavaScript, still get a normal page after the emails, as before.

If an email fails

- Every email result is stored in `email_log`, one row per recipient. It holds `pending`, `sent`, `failed` or `skipped`, the number of attempts and the error message. Passwords never appear in the error text, and this was tested.
- **The enquiry is never lost.** It is saved before any email is attempted.
- **Retry:** open **Admin → Enquiries → (the enquiry)** and click **Resend**. Only the emails not yet sent are sent again, and duplicates are prevented by the log.

- **Automatic retry:** the deployment guide adds a cron job running `php index.php setup retry_emails` every 15 minutes.
- **The visitor's message** is the same short success message either way, because their enquiry is saved.

Success message

- **Text:** "Thank you! Your enquiry has been submitted successfully."
- **No reference number** is shown; it stays in the admin and in the confirmation email.
- **Timing:** it closes after 3.5 s and has a close button.
- **Shown only after** the server confirms the save.
- **Same everywhere:** all four forms use the same toast.

How it was measured

- **Script:** `t59_speed.php`, run on the **isolated test copy**. It has its own database (`girzock_test`), PHP's built-in server on port 8096, and a local mail server (`smtp_slow.php`) that waits 3 s before accepting each email. No real email was sent, and the real database was not touched.
- **What was timed:** each run gets the homepage token, then times a real popup submission with curl, end to end. It checks the reply is `ok`, checks the row is in the database, and after 12 s checks the email log.
- **Before:** measured on the code before the change, on the same setup.
- **On Apache:** PHP's built-in server was used for the measurement above. To check the same steps on Apache, which the live site uses, a temporary file under the local XAMPP Apache sent the reply the same way and then waited 5 s:
- – the reply arrived in **4 ms** in each of 5 runs;
- – the 5 s step still finished afterwards;
- – the file was deleted after the test.

What could still slow it on the live server

Some hosts buffer PHP output or compress it on the way out, which can hold the reply until the script ends. The code already asks Apache not to compress this response. Step 8 of `PRODUCTION_DEPLOYMENT_GUIDE.md` covers the live check:

1. send one enquiry;
2. the message should appear in under a second;
3. the email log should show both emails as sent.

Tests that cover this

The counts are in `FINAL_REGRESSION_TEST_REPORT.md`.

- Public, admin and forms suites: the enquiry is saved, both emails reach the local mail catcher, there are no duplicates on a double submit, failures are logged and Resend delivers them. These tests now wait up to 15 s for the emails, because the emails now come after the reply.
- Browser tests in Chromium, Firefox and WebKit: the toast text, no reference, auto-close and the close button.

Appendix R: Forms and Notifications

Date: 7 November 2026.

Forms on the site

Form	Where	Sends to	Message field
Project enquiry	Homepage	`contact/submit`	Required (at least 10 characters)
Popup enquiry	Promotional popup, all public pages	`contact/submit` (`form_type=popup`)	**Optional**
Contact	Contact page	`contact/submit`	Required
Short message form	"Get in Touch" panels on inner pages	`contact/submit`	Required
Job application	Career pages	`careers/apply` (full page post)	Cover letter optional; resume required

Required in every enquiry form: name, email, phone and service. The short message form asks for a subject instead of a service.

The popup's optional message is enforced on both sides:

- **In the browser:** the field has no `required` attribute and is marked "(optional)".
- **On the server:** `Contact::validate` skips the message check only when `form_type` is `popup`.

Every other form still requires a message.

One notification for every form

`GirzockToast` in `assets/js/girzock.js` gives every form the same notification.

Situation	Toast	Shown when
Saved	Green, check icon: "Thank you! Your enquiry has been submitted successfully." No reference number is shown; it is still saved and appears in the admin and in the confirmation email	**Only after the server replies that the enquiry was saved**
Field errors	Red: "Please check the highlighted fields and try again."	Browser or server validation fails; field messages stay beside each field
Failure	Red: "Something went wrong. Please try again or contact us directly."	Network failure or server error; rate-limit replies keep their own message
Job application	The same toast style, from the server's success or error message	After the page reloads

Behaviour:

- Slides and fades in at the top right on desktop, and at the bottom on phones.
- Closes after 3.5 seconds; hovering pauses it, and it has a close button.
- Updated 7 November 2026 (shorter message, no reference, 3.5 s). See `FORM_SUBMISSION_PERFORMANCE_REPORT.md` for the faster reply.
- Success toasts are announced politely (`role="status"`); errors immediately (`role="alert"`).
- The toast sits above the popup overlay. After a popup success, the popup closes 0.7 s later, so the toast stays visible.
- While sending, the button is disabled, marked busy and shows "Sending...", which prevents duplicate submissions.
- **Entered values are kept** on any failure. The form is cleared only after a confirmed save.
- With reduced motion turned on, there is no animation.

Server protections (unchanged, retested)

Protection	Detail
CSRF token	On every form

Protection	Detail
Server-side validation	Every field
Honeypot field	Catches automated submissions
Duplicate detection	Content hash
Rate limit	5 enquiries per 10 minutes per connection
Order of work	The enquiry is saved before any email is sent
Email results	Recorded per recipient in `email_log`. A failed email never removes the enquiry, and the cron job retries it

Files

- **Script:** `assets/js/girzock.js`
- **Styles:** `assets/css/girzock.css`
- **Server:** `application/controllers/Contact.php`
- **Form view:** `application/views/frontend/partials/enquiry_form.php`
- **Popup:** `application/views/frontend/partials/promo_popup.php`

Test results are in `TESTING_REPORT.md`.

Appendix S: Popup Reappearance Settings

Date: 7 November 2026 **Applies to:** the promotional popup on the public website and its settings page at **Admin → Promotional Popup**

What changed

Before this change the admin could pick only "once per session", "once per day" or "every visit". A visitor who closed the popup still saw it again on the next visit.

You can now choose when the popup may appear again, and for how long it stays hidden after a visitor closes it or sends the form. The settings are on the same admin page. No source code edits are needed.

Settings on the admin page

Setting	Choices	Default	What it does
When it may appear again	After a set number of days (recommended); Never again once the visitor closes it; Once per browser session; On every page load	After a set number of days	Decides when a visitor who has already seen the popup sees it again
Days hidden after the visitor closes it	1 to 365	7	Used by "After a set number of days"
Days hidden after the visitor sends the form	1 to 365	30	Applies to every choice above. A visitor who has already sent an enquiry is not asked again
Reset visitor dismissals (button)	—	—	Every visitor who closed the popup or sent the form sees it again, following the rules above. It asks for confirmation first
Turn on / Turn off (button)	—	On	Off hides the popup for everyone, whatever any browser has stored

The existing settings are unchanged:

- start and end date;
- desktop and mobile switches;
- delay;
- images;
- title;
- description;
- preview.

How each choice behaves

Choice	First visit	Closed, then refreshed	Same browser session, next page	New session, within the days limit	New session, after the days limit
After a set number of days	Shows	Hidden	Hidden	Hidden	Shows
Never again once closed	Shows	Hidden	Hidden	Hidden	Hidden, until an admin reset
Once per browser session	Shows	Hidden	Hidden	Shows	Shows
On every page load	Shows	Shows	Shows	Shows	Shows

These rules apply to all four choices:

- **After a successful form submission,** the popup stays hidden for the "Days hidden after the visitor sends the form" value under every choice, including "On every page load".
- **"Turn off" always wins.** The popup is not even rendered in the page.

- **Turning it back on does not clear what browsers remember.** Use **Reset visitor dismissals** to show it to everyone again.
- **The start and end dates and the desktop and mobile switches still apply** on top of these rules.

What the browser stores

Only dates are stored, no personal details:

Name	Type	Content	Lifetime
`gzPopup`	localStorage	`{"v":"<reset number>","closed":<time>,"submitted":<time>}`	Until the visitor clears site data
`gzPopupSession`	sessionStorage	The reset number	Until the tab is closed

Reset visitor dismissals raises the reset number, which is the `popup_visitor_version` setting. Browsers ignore any stored record with an older number. This is how a reset reaches every visitor without contacting their browsers.

The Cookie Policy (`/cookie-policy`) now lists both names. They replace `gzPopupSeen`, which is no longer used.

Files changed

- `application/migrations/013_popup_reappearance.php` (new). It adds four settings with `INSERT IGNORE`, so a re-run never overwrites saved values:
- – `popup_reappear` = `days`
- – `popup_dismiss_days` = `7`
- – `popup_submit_days` = `30`
- – `popup_visitor_version` = `1`
- `application/config/migration.php`: the migration version is now 13.
- `application/models/Settings_model.php`: the new defaults, and the values passed to the page.
- `application/controllers/admin/Popup.php`:
- – checks the new fields: the choice must be one of the four, and the days must be whole numbers from 1 to 365;
- – adds the new `reset_visitors()` action;
- – "Reset to default settings" keeps the reset number, so it does not show the popup again to everyone by accident.
- `application/views/admin/popup/index.php`: the new fields and the reset button.
- `application/views/frontend/partials/promo_popup.php`: passes the rules to the page as data attributes.
- `assets/js/girzock.js` and `girzock.min.js`: the rules above.
- `application/views/frontend/legal/page.php`: Cookie Policy table.
- `assets/css/girzock.css` and `girzock.min.css`: fixed message box, button spacing, and the closed service list removed from the popup layout.

The local database has run migration 013. A backup was taken first, in `../backups/`.

Message box and layout in the popup

Item	Result
Message label and placeholder	"Tell us about your project requirements (optional)"
Message required?	No, in the popup only. The Contact page form still requires it
Message box height	Fixed at 96 px (84 px on phones), `resize: none`. Long text scrolls inside the box
Company placeholder	Shortened to "Company name (optional)", so it is no longer cut off
Space above the submit button	Increased; at least 18 px measured at every laptop size below

Test results

These tests ran on the isolated test copy, which has its own database, server and mail catcher, in Chromium, Firefox and WebKit.

Suite	Final result
Popup in the browser (`t52_popup.js`)	**438 passed, 0 failed**
Popup admin (`t53_popup_admin.php`)	**149 passed, 0 failed**
Real local site, read-only (`t55_real_popup.js`)	**150 passed, 0 failed**

The first full run found 23 failures, and each was resolved:

1. **18 were a real fault:** the form had a 44 to 102 px scrollbar at every laptop size. – **Cause:** measured in a browser. The closed service list was invisible but still took up space below the field, so the form scrolled. Without it, the form ends well inside the 646 px dialog. – **Fix:** in the popup only, the closed list is now removed from the layout (`display: none` until it opens). The list opens up or down from the field's position, so its behaviour is unchanged. – **After the fix,** the scroll height equals the visible height at every size listed below.
2. **3 were a test setting:** the admin suite had already raised the reset number, so the browser suite now starts from a known value.
3. **2 were test timing:** in Firefox and WebKit the toast was measured during its 0.3 s slide-in. The test now waits for the slide to finish.

The full counts are in `FINAL_REGRESSION_TEST_REPORT.md`.

Checked	Result
"After N days" (7): hidden after closing and refreshing; hidden after 6 days; shows again after 8 days	Passed
Sent the form 20 days ago (limit 30): hidden. 31 days ago: shows	Passed
"Never again once closed": not shown again, even in a new tab	Passed
"Once per session": hidden for the rest of the session; a new session shows it	Passed
"On every page load": shows again after closing and refreshing	Passed
Turned off with "On every page load" chosen: not in the page at all	Passed
Admin "Reset visitor dismissals": a visitor who closed it sees it again	Passed
Stored record holds only `v`, `closed` and `submitted`	Passed
No scrollbar inside the form at 1920×1080, 1536×864, 1440×900, 1366×768, 1280×720 and 1024×768	Passed, after the fix above
22 px between the message box and the button; button centred and inside the dialog	Passed
Message box stays 96 px with 1,300 characters typed; resize is off	Passed
Admin form: rejects an unknown choice, 0 days, 366 days and text in the days fields; saves valid values	Passed
Re-running migration 013 keeps saved values	Passed

Points to know

- **Browser storage is per browser and per device.** A visitor who closes the popup on a phone may still see it on a laptop. Private browsing windows forget everything when they close.
- **Visitors who block site storage** see the popup according to the session rule, because nothing can be remembered for them.
- **After testing the popup yourself,** use **Reset visitor dismissals** only if you want every visitor to see it again. You can clear just your own browser instead, using the browser's site data settings.

Appendix T: Promotional Popup Implementation

Date: 7 November 2026. Scope: the local build. Nothing has been deployed.

What visitors see

- **Desktop and tablet (768 px and wider):** two columns. The banner `assets/images/popup/diwalipopup-left-desktop.webp` (1024 x 1536) is on the left, at its own shape, and the enquiry form is on the right.
- **Mobile (under 768 px):** the banner `assets/images/popup/diwalipopup-mobile.webp` (1199 x 1312) sits on top, with the form below. The popup scrolls inside itself, and the close button stays visible.
- **Behaviour:**
- – It opens a set number of seconds after the page opened; the default is 5.
- – It closes with the close button, the Escape key, or a click outside it.
- – The page behind it cannot scroll while it is open.
- – It has a fade and scale animation. With reduced motion turned on, it simply appears.
- **Images:** only one image is downloaded, the one for the current screen size, about 1.5 s before opening. Neither image is in the page HTML, so the page's own loading is not affected. A missing or failed image leaves a form-only popup, with no broken image.
- **Light in both themes:** the popup keeps its light design even when the site is in dark mode.

The form

It is the existing homepage enquiry form, loaded a second time with its own field ids. It uses the same validation, CSRF token, honeypot, duplicate check and rate limit. It posts to the same `contact/submit`, saves to `contact_enquiries`, and sends the same company and client emails. The source is recorded as `popup/<page>`. No new enquiry system or table was created.

Admin: Promotional Popup

Sidebar > Promotional Popup (`/admin/popup`). It is in the role permission matrix; only Super Admin has it by default.

Control	Detail
Enable popup	On/off; also a one-click Turn on/off button
Title, description	Title up to 120 characters; its last word is shown in blue
Image description	Alt text read by screen readers
Display delay	0 to 120 seconds, default 5
Start and end date	Optional; the end date is inclusive
When it may appear again	Replaced on 7 November 2026: after a set number of days (default 7 after closing, 30 after sending the form), never again once closed, once per session, or every page load, plus "Reset visitor dismissals". See `POPUP_DISMISSAL_SETTINGS_REPORT.md`
Desktop / mobile visibility	Separate switches
Desktop and mobile images	Preview, dimensions, file size, path, upload or replace, and delete
Preview	Desktop (1280 px) or mobile (390 px) preview in a frame. It works while the popup is off and is visible only to the signed-in admin
Reset to default settings	Restores the settings and supplied images. Uploads stay in the Media Library

Uploads:

- Accepted: WebP, PNG or JPG, up to 5 MB, 300 to 6000 px on each side.
- The type is read from the file's content, the extension must match it, and animated images are refused.
- The file is stored **byte for byte, without recompression**, under a random name in `assets/uploads/YYYY/MM/`. Scripts never run from that folder.

Deleting:

- Every delete asks for confirmation, and the server also requires a confirmation field.
- An uploaded file is removed only when no setting still uses it.
- The supplied default images are never deleted from disk; deleting one only removes it from the popup.

Database

Migration `011_promotional_popup` adds 12 `popup_*` keys to the existing `website_settings` table. It uses `INSERT IGNORE`, so a re-run never overwrites saved values. It was applied to the real database on 7 November 2026, after a backup. The other 30 settings were confirmed unchanged by checksum. No new table was created.

Files

- **New:**
- – `application/controllers/admin/Popup.php`
- – `application/views/admin/popup/index.php`
- – `application/views/frontend/partials/promo_popup.php`
- – `application/migrations/011_promotional_popup.php`
- **Changed:**
- – `Settings_model.php`: `popup_defaults()`, `popup()`
- – `Media_manager.php`: `store_original_image()`
- – `MY_Controller.php`: `popup_state()`
- – `layouts/main.php`
- – `partials/enquiry_form.php`: options for a second copy
- – `admin/layouts/main.php`
- – `config/girzock.php`
- – `config/migration.php`
- – `girzock.js`
- – `main.js`: exposes the smooth-scroll instance so it can pause
- – `girzock.css`
- – `admin/js/admin.js`: confirmation read from the clicked button

Test results

Suite	Where	Result
Popup admin (settings, validation, uploads, attack files, delete, reset, toggle, dates, preview, permissions, CSRF, migration re-run)	Isolated copy	135 passed, 0 failed
Popup browser (timing, images per screen size, closing, scroll lock, focus, frequency, switches, missing image, reduced motion, dark theme, validation, real submission with both emails, admin preview, delete confirmation)	Isolated copy, Chrome, Firefox, WebKit	314 passed, 1 failed
Popup on the real site, read-only	Real local site, three engines	150 passed, 0 failed

The single failure was external: WebKit logged "Could not resolve hostname" when the PC briefly lost DNS for Google Fonts.

Measured opening times: 5,155 to 5,509 ms with a 5 s delay. A 10 s delay opened at 10 s.

Real email: an enquiry you sent through the popup on 7 November 2026 at 16:06 produced both emails. The company notification and the client confirmation were accepted by your SMTP server. Inbox arrival is for you to confirm.

Your decisions

- **End date:** the popup is on with no end date. Set one so the offer does not run on after Diwali.
- **Offer wording:** the "20% off" wording is in the image. Your Terms page says offers apply on the terms stated with them.
- **"Book Free Demo":** it is part of the image, not a button, so clicking it does nothing.

Appendix U: Blog Publishing Guide

For admins of the GIRZOCK Technologies website. Every step below matches the current admin panel.

1. Sign in and start a post

1. Go to `https://girzock.com/admin/login` and sign in.
2. In the sidebar, open **Blog Management**.
3. Click **Add**. The page is `/admin/blog/create`.

2. Write the post

Field	What to enter	Notes
Title	A clear title in plain words, such as "Why Every Business Needs a Professional Website in 2027"	This becomes the page heading (H1)
Slug	Leave blank	Made from the title and kept unique. If you change it later, the old address redirects automatically (301)
Excerpt	One or two sentences	Shown on blog cards, and used as the search description if you leave the SEO description empty
Content	The article	Use **Heading 2** for main sections and **Heading 3** for sub-points. Never use Heading 1 in the content. Link to related services and posts
Category	Choose one	Categories with no published posts are hidden from search
Tags	A few words, separated by commas	New tags are created automatically. Tag pages are not indexed
Author	Leave blank to use your name	
Reading time	Leave blank	Calculated for you
Featured image	JPG, PNG or WebP, up to 5 MB	Converted to WebP, with smaller copies for phones
Image alt text	Describe what the picture shows	Needed for accessibility and image search. If empty, the title is used

Writing tips:

- Answer one question well.
- Name a place only where it is genuinely relevant.
- Never invent statistics, clients or results.
- End with a link to the relevant service and to the Contact page.

Internal links: to link to a page on this site, use the address form `site:services/website-development`. The site turns it into the right full address on any domain.

3. SEO panel (optional, below the content)

Field	Guidance
SEO title	Under 60 characters. If blank: "Title | GIRZOCK Technologies"
Meta description	120 to 160 characters, a summary that makes people want to click
Focus keyword	For your own reference only; it is not shown on the page
Open Graph title / description / sharing image	Only if social media should show something different
Canonical URL	Leave blank unless the article was first published elsewhere
Search engine indexing	Leave on the default (index) for a normal post

4. Save, preview and publish

1. Set **Status** to **Draft** and save. Drafts are not public: visitors get "page not found", and drafts are not in the sitemap.

2. Click **Preview page** at the top of the edit form. It opens the post with `?preview=1` in a new tab, visible only to you, and marked so search engines ignore it.
3. When ready: – To publish now, set Status to **Published**. If the publish time is empty, the current time is used. – To publish later, set Status to **Scheduled** and a future publish time. It goes live at that time on its own.
4. **Unpublish** any time with the toggle in the list. **Delete** removes the post from the site; its address then answers "gone" (410).

5. What happens automatically after publishing

- The post appears first in the blog listing and in its category.
- Its page has its own title, description and canonical address.
- BlogPosting structured data is added, with the publish and update dates.
- The featured image becomes the social sharing image.
- The post is added to `sitemap.xml` straight away.
- Related posts, previous/next links, the recent posts list and tag links connect it to other content.

6. Help search engines find it (manual)

1. In **Google Search Console**, use **URL inspection** on the new address, then **Request indexing**.
2. The sitemap only needs to be submitted once, at launch.
3. Optionally, do the same in **Bing Webmaster Tools**.
4. Check back in a week or two. Indexing is not instant or guaranteed, and rankings depend on usefulness and competition.

7. Updating an older post

- **Change the content when it is out of date.** The update date and sitemap date change automatically.
- **Change the slug only when necessary.** The redirect from the old address is automatic, but update any links you added yourself.
- **After changing the featured image,** update its alt text.

Appendix V: Performance Optimisation Report

Date: 7 November 2026. Measured on the local server. These are not production figures.

Changes made, without reducing image quality

Change	Effect
Homepage background video loads only when it comes near the screen	Homepage weight fell from **8.48 MB to 3.81 to 3.94 MB** in Lighthouse
16:9 box held for the video	No layout shift when the video loads (it was 0.12 when tested without the box)
Popup images requested only for the current screen size, 1.5 s before opening	No popup image in the initial page load
`text/javascript` added to the compression list	JavaScript compresses on servers with `mod_deflate`

Lighthouse, mobile (after the changes, popup on)

Page	Performance	SEO	Accessibility	Best practices	LCP	CLS	Weight
Home	37 / 49	92	94	93	12.5 / 17.5 s	0.049	3.94 / 3.81 MB
About	51 / 53	92	93	96	16.6 / 16.7 s	0.149 / 0.148	3.09 MB
Contact	52 / 56	92	97	100	16.0 s	0.125 / 0.052	3.71 MB
Blog	60 / 56	92	96 / 97	100	16.7 / 17.7 s	0.001 / 0.000	3.25 / 3.20 MB

Each page was run twice. Scores vary between runs on this PC; compression is off locally, and the PC's connection to Google Fonts was slow during these runs.

What still limits speed

1. **Google Fonts arrive late.** The About shift of about 0.15 occurs exactly when fonts finish loading (measured at 3,098 ms and 7,504 ms). It disappears when fonts are cached or blocked. The fix is to self-host Sora and Manrope, which needs your approval because it changes how fonts are delivered.
2. **`style.min.css` is 608 KB** and blocks rendering. Lighthouse estimates 838 KB of unused CSS across the template.
3. **Large images:** the preloader logo `girzock-pre-logo.png` is 350 KB, `layer11.png` 339 KB and `layer11-2.png` 234 KB. WebP copies of these PNGs were not smaller, so none was made; quality stays as is. Restoring `girzocl-loader.webp` would save about 250 KB.
4. **Contact page map:** Google Maps loads about 1.9 MB of its own scripts. The map is already lazy-loaded, but Lighthouse's tall test screen reaches it.
5. **No compression locally.** Measure again on the server after deployment.

Unused images

90 of 858 image files (3.3 MB) are not referenced in PHP, CSS, JavaScript, migrations, seed files, `.htaccess` or any text column of any database table. Admin uploads not referenced: 0.

This replaces the earlier estimate of 480, which did not search the database or match WebP copies to their originals.

Nothing was deleted. A name built by code could still use a file, so confirm the list before removing anything. Files by folder:

Folder	Files
`assets/images/event`	32
`assets/images/feature`	21
`assets/images/service`	17
`assets/images/generated/photo/portfolio`	6

Folder	Files
assets/images/generated/photo/where-we-work	6
assets/images/project	4
assets/images/bg	2
assets/images/icon	2

Appendix W: Bug Fix Report

Date: 7 November 2026. Each item says what was wrong, what changed and how it was verified.

#	Issue	Change	Verified	Status
1	`/blog/tag/<tag>/page/2` showed page 1	Route `blog/tag/(:any)/page/(:num)` added; `Blog::tag()` takes the page	`/blog/tag/business/page/2` now marks page 2 current	Fixed
2	JavaScript would not be compressed: Apache serves `.js` as `text/javascript`, missing from the compression list	Added `text/javascript` and `application/x-javascript` to `.htaccess`	Apache config test passes. `mod_deflate` is off locally, so compression must be confirmed on the server	Fixed, server check pending
3	An empty blog category was indexable	Categories with no published posts are noindex	`Blog::category()` sets noindex when there are 0 posts	Fixed
4	"Unlinked portfolio page"	**No fix needed. This was an error in my earlier audit:** its crawler skipped any URL containing `/admin`, including `/portfolio/admin-dashboard-sample-concept`. The page is linked three times on `/portfolio`	Fresh crawl: 89 URLs, all linked	Report corrected
5	`X-Frame-Options` sent twice, and `X-Powered-By` exposed	Header removed from `.htaccess` (PHP sets it: SAMEORIGIN on public pages, DENY in the admin panel). `X-Powered-By` removed	Response headers show one `X-Frame-Options` and no `X-Powered-By`	Fixed
6	No Privacy, Terms or Cookie pages	Added `/privacy-policy`, `/terms-and-conditions`, `/cookie-policy`, footer links and sitemap entries. Text describes only what the site actually does	Pages return 200 with one H1 each	Added; **needs your legal review**
7	Homepage video downloaded 4.8 MB on every visit	The video loads only when it comes near the screen, with a 16:9 box held in place so nothing moves	Homepage weight 8.48 MB before, 3.81 to 3.94 MB after. Video box 695 px before and after loading, no layout shift	Fixed
8	Dark theme: service dropdown text white on white	List items keep dark text	Dropdown suite 202/0	Fixed
9	Admin "Delete image" did not ask for confirmation	`admin.js` reads the question from the button that was clicked, which fixes any admin button with `data-gz-confirm`	Browser test: confirmation shown, cancel keeps the image	Fixed
10	Safari: Escape did not close an open dropdown, because Safari does not focus buttons on click	Dropdowns also close on Escape at document level	WebKit test passes	Fixed
11	Popup scroll lock moved the page by the scrollbar width	Scrollbar space kept while locked	Layout shift from opening the popup: 0.0013	Fixed

Reviewed, not changed

- **Production settings:** documented in `PRODUCTION_DEPLOYMENT_GUIDE.md`. They must be set on the server, not locally.
- **Secure cookies and HTTPS:** same. `COOKIE_SECURE=1` and the HTTPS rules are ready to enable on deployment.
- **Real SMTP:** sign-in verified without sending (Gmail answered 235). Your popup enquiry at 16:06 sent both emails, which the server accepted.
- **Job vacancies:** six openings still publish `JobPosting` data with no closing date. Only you can confirm they are genuine.
- **Unused images:** 90 files (3.3 MB) are not referenced in PHP, CSS, JavaScript, migrations, seed files or any database column. This replaces my earlier figure of 480, which did not search the database. **Nothing was deleted.** The list is in `PERFORMANCE_OPTIMIZATION_REPORT.md`.
- **About page layout shift (up to 0.15):** happens when Google Fonts arrive after the loading screen hides. It disappears when fonts are cached or blocked. The recommended fix is self-hosting Sora and Manrope; it was not done, because it changes how fonts are delivered.

Appendix X: Full Website Page Inventory

Date: 7 November 2026 **Sources:** the routes (`application/config/routes.php`), the database (read-only), `/sitemap.xml`, and a crawl of the local site that follows every internal link from the homepage and the sitemap. Nothing here is estimated.

Counts

What	Count
Unique public pages (pagination is part of its listing, not a separate page)	**87**
... indexable	**61**
... noindex on purpose (sample portfolio items, tag pages, an empty category)	26
Pagination URLs (`/blog/page/2`, `/blog/tag/business/page/2`)	2
URLs in the sitemap	61
Public page templates (views)	19
Redirect-only addresses (10 old `.html` pages, `/terms-and-conditions`)	11, all 301
Non-page endpoints (`sitemap.xml`, `robots.txt`, `search`, `contact/submit`, `careers/apply`)	5
Admin screens (not public, never indexed)	40

Dynamic templates and their published records

Each template serves every record of its type. Unpublished records return 404 to visitors.

Template	Route	Controller	View	Table	Public rule	Live	All records
Service detail	`services/(:any)`	Services::detail	`services/detail.php`	`services`	`status='active'`	16	16
Product detail	`products/(:any)`	Products::detail	`products/detail.php`	`products`	`status='published'`	6	6
Portfolio item	`portfolio/(:any)`	Portfolio::detail	`portfolio/detail.php`	`portfolio_projects`	`status='published'`	13	13
Case study	`case-studies/(:any)`	CaseStudies::detail	`case-studies/detail.php`	`case_studies`	`status='published'`	3	3
Job opening	`careers/(:any)`	Careers::detail	`careers/detail.php`	`career_openings`	`status='active'`	6	6
Blog post	`blog/(:any)`	Blog::detail	`blog/detail.php`	`blog_posts`	`status='published'`	11	31
Blog category	`blog/category/(:any)`	Blog::category	`blog/index.php`	`blog_categories`	every row; tags and empty categories are noindex	7	7
Blog tag	`blog/tag/(:any)`	Blog::tag	`blog/index.php`	`blog_tags`	every row; tags and empty categories are noindex	27	27

Draft blog posts: 20 (not public, not in the sitemap; previews are noindex). Of the 27 tags, 12 are used by published posts and reachable from the site; tag pages are noindex either way.

Every public URL

Columns:

- **Index:** the robots setting.
- **Canonical:** "Self" means the page names itself as the main address.
- **Links in:** the number of other crawled pages that link to it.
- **Content:** rated as in `CONTENT_QUALITY_AUDIT.md`.

The 404 page, for any unknown address, returns HTTP 404 with `noindex` and the standard header and footer.

Admin modules and protected routes (not public pages)

All are under `/admin/`. They require sign-in, send `noindex, nofollow`, and `/admin/` is blocked in `robots.txt`. Without a session, every one redirects to `/admin/login`.

Module	Screens	Routes
Sign in	Sign in; Forgot password (not linked from the card); Reset password; Change password (forced on first sign-in)	`admin/login`, `admin/logout` (POST), `admin/forgot-password`, `admin/reset-password/{token}`, `admin/profile/password`
Dashboard	Dashboard; Search	`admin`, `admin/dashboard`, `admin/dashboard/search`
Enquiries	List; Detail	`admin/enquiries`, `admin/enquiries/view/{id}` and its actions
Job applications	List; Detail	`admin/job-applications`, `admin/job-applications/view/{id}`
Services, Products, Portfolio, Case studies, Careers, Blog	List, Add, Edit for each (18)	`admin/{module}`, `admin/{module}/create`, `admin/{module}/edit/{id}`
Categories	Categories	`admin/categories`
Media Library	Library; Picker	`admin/media`, `admin/media/picker`
SEO Management	Pages and redirects; Page SEO editor	`admin/seo`, `admin/seo/page/{key}`
Promotional Popup	Settings	`admin/popup`
Website Settings	Settings, social links, SMTP, SEO defaults	`admin/settings`
Admin users	List; Add; Edit; Roles	`admin/users`, `admin/users/create`, `admin/users/edit/{id}`, `admin/users/roles`
Profile	Profile	`admin/profile`

40 screens in total. Admin routes are not counted as public SEO pages.

Appendix Y: Archive: Final Audit (6 November)

> Superseded. Kept for history; the current appendices take precedence.

Date: 6 November 2026. Site tested: `http://localhost/girzock-website/` (local XAMPP). The site is not yet public, so nothing that needs a public URL has been run.

> **Superseded.** This is an earlier snapshot. The current results are in `COMPLETE_SEO_SCORE_REPORT.md`, `COMPLETE_PAGE_INVENTORY.md` and `CONTENT_QUALITY_AUDIT.md` (7 November 2026). Since this report, LinkedIn and Facebook icons are hidden until real addresses are added, and the six short blog posts were rewritten with H2 sections.

1. Summary

The content, counter, articles and technical SEO changes are live on the local site, and every automated test passes.

The site is not cleared on plagiarism. No external checker was available, so no originality score exists. See section 8.

Three decisions are waiting on the business owner:

1. Confirm or remove Mobile App, SEO and CRM services (section 3).
2. Confirm the image and template licences (section 10).
3. Run the external plagiarism check (section 8).

2. Homepage counter

Check	Result
Wording	"10+ Core Services for Your Business" in both hero slides
Final value	Settles at `10+` at 1920, 1440, 1366, 1024, 768, 480, 375 and 320 px
Card size	Unchanged design; no text or page overflow at any of those widths
Screenshots reviewed	1440 and 375 px
Other outdated references	About page counters updated; "services under one roof", "service disciplines" and the Case Studies count now show the live number of active services (15)
Supported by the listing	Yes: 15 active services

The counter counts up over about 6 seconds, so it briefly shows `9+` on the way to `10+`. This is the original animation.

3. Services (15 verified)

All 15 pages load and have a unique title and description, one H1, a canonical URL, Open Graph tags, breadcrumbs, Service schema and internal links.

Website Development, Custom Software, Web Applications, E-commerce, WordPress, UI/UX Design, CRM and Business Software, Mobile Apps, Cloud Solutions, AWS Cloud, API Integration, Website Maintenance, SEO Services, Digital Transformation, IT Consulting.

Changes made: a specific local paragraph was added to the 12 pages that lacked one. Generic repeated headings became service-specific ("Problems We Solve with...", "How We Deliver..."). The unsupported line "We often work with AWS" was rewritten, and a missing full stop was fixed.

Services needing business approval

The original site does not establish these, so the pages describe what the service involves and make no experience claims. Confirm each one, or unpublish it in the admin panel.

Service	What is unconfirmed
Mobile App Development	No evidence on the original site

Service	What is unconfirmed
SEO Services	No evidence on the original site
CRM and Business Management Software	Only partly supported, by the Business Management Software product

Removing all three would still leave 12 services, so "10+" stays true either way.

4. Blog

Published: 5. Remaining drafts: 11. The older six posts remain published, so 11 posts are live in total.

Article	Words	Search intent	Why this one
Why Small Businesses in Tirunelveli Need a Professional Website	980	Awareness, local	The primary location, and readers who have not yet decided
How to Choose the Right Web Development Company in Tirunelveli	923	Comparing providers	Readers close to hiring
Website Development Cost in Tamil Nadu: A Business Guide	916	Cost	A very common question, answered without invented prices
E-commerce Website Development for Growing Businesses in Tamil Nadu	914	Planning a store	A confirmed service with a distinct audience
Website Maintenance and Security: A Complete Business Guide	878	Existing website owners	A different reader: someone who already has a site

Why the others stayed as drafts: the CRM and mobile app articles depend on services awaiting approval. The Thoothukudi, Nagercoil, Kanyakumari and Thiruvananthapuram articles target the same kinds of search from other towns, so publishing them alongside the Tirunelveli ones adds little yet. The online presence article overlaps with the first article above.

Changes before publishing:

- About 250–350 new words per article, including a worked example or checklist and one extra FAQ.
- Descriptive alt text and a distinct image for each.
- Real publication dates, with a modified date from the database.
- BlogPosting schema, canonical URL, internal service links and a call to action.

Factual checks on the articles:

- The Consumer Protection (E-Commerce) Rules 2020 were checked, and readers are told to confirm their own obligations with an adviser.
- The 3-2-1 backup guideline was checked and is not attributed to any organisation.
- A spot check found one near-match online ("A backup you have never restored is only a hope"), which was reworded.
- The articles contain no prices, statistics, clients or results.

Not independently verified: the sentence "AWS has regions in India" is from my own knowledge; a search did not confirm the region names, so none are named.

5. Public page audit

Pages audited: Home, About, Services, 15 service pages, Products, Portfolio, Case Studies, Blog, the 11 published posts, Contact, Careers and Areas We Serve. A spell-check (en-GB) flagged only valid words: Contentful, yourbusiness, tagline, Storefront and taluk.

Page	Removed or rewritten
Home	"Global Outlook" and the 26 language and flag links became "Who We Help" with 26 kinds of organisation, in the same layout
Home	"Notable Accomplishments and Key Milestones" became "What GIRZOCK Technologies Offers at a Glance"
Home	"Measurable results" promise removed
Home	Six fictional partner logos replaced with technology logos; "Partner With" became "Work With"
Home	FAQ now lists all services; brand casing fixed. Your H1 was kept as you wrote it

Page	Removed or rewritten
About	Counters corrected; brand casing fixed
Areas We Serve	Wording that implied existing clients became "may" and "can"
Careers	Inaccurate reference to "the form below" corrected
Contact and footer	Phone number added; address now says "Tirunelveli District"
Blog	Watermarked image replaced on the live post and on two articles; `blog/page/2` given its own title, description and heading

Licensed template code was left alone: 37 "Aiero" attribution comments remain in `style.css` and `main.js`. They are not in any page's HTML.

6. Technical SEO

Item	Result
Pages crawled	84: 58 indexable, 26 noindex
Sitemap	57 URLs; includes the 5 new articles, excludes all 11 drafts
Robots and exclusions	Drafts return 404; preview works for admins only
Titles, descriptions, H1s	Unique across indexable pages and within length limits
Headings	Card headings moved from H4 to H3 so levels no longer skip. Two exceptions below
Structured data	Organization, Service, BlogPosting and BreadcrumbList parse correctly with my own parser. No ratings or reviews
FAQ schema	Deliberately not added, because Google retired FAQ rich results
Images	All audited pages have an alt attribute, and every image checked returns 200
Blog alt text	New `featured_image_alt` field, editable in the admin panel

Heading exceptions: the "Stages" counter on the Services page stays an H4 because its styling depends on it. Homepage footer titles stay as `div` elements, as on the original site.

Not validated externally: Google's Rich Results Test and Search Console need a public URL. Run them after launch.

Lighthouse (mobile, local server)

Page	Performance	Accessibility	Best practices	SEO	LCP	CLS
Home	53	94	93	92	12.6 s	0.047
Article	60	96	100	92	13.4 s	0
Service	60	96	100	92	11.7 s	0

LCP is far above Google's 2.5 s target. Compression is off locally, so these figures should be measured again on the production host. Desktop Lighthouse was not run this round.

7. Testing

Tests that write data ran only on an isolated copy (separate database, private folder, fake keys and a local mail sink). The real site received read-only requests, and migration 004.

Suite	Where	Result
Fresh install through migration 004	Isolated	Passed; second run makes no changes
Public suite	Isolated	107 passed, 0 failed
Admin suite (drafts, SEO fields, slug redirects, categories, search and more)	Isolated	291 passed, 0 failed
SEO and delete suite	Isolated	176 passed, 0 failed
Browser suite	Isolated	54 passed, 0 failed
Final content checks	Isolated and real	586 passed, 0 failed on each
Read-only crawl	Real	134 passed, 0 failed

Suite	Where	Result
Admin panel click test	Real	10 passed, 0 failed
Heading styles, H4 against H3	Isolated	1,356 compared in light and dark at 3 widths; 0 differences
Internal duplicate check	Real data	See section 8

Test expectations changed in this round. These were outdated by the intended changes, and each was reviewed: draft count 16 to 11, a remaining draft used for the draft checks, new service headings, 15 services in the mega menu, the budget check narrowed to the form field, and the monthly post count now read from the database. The `/about` title restored by the admin test was also corrected.

Real data after migration: admin password hash and SMTP settings are unchanged (checksums compared before and after), `.env` is unchanged, and there are 0 enquiries, 0 applications and 3 uploads, as before. The test environment has been removed.

Not tested in this round: a real email through Gmail, and a live enquiry on the real site, so no test data or mail would be created there. The real admin panel was exercised only by the click test.

Layout against the original site (1440, 768, 375 px)

No page has new horizontal overflow or failed requests.

Difference	1440	768	375	Cause
Footer	+31	+34	+122	Phone line and three-line address
Who We Help section	within 2	+40	-60	New labels
Home FAQ	+30		+60	Answer now lists all services
About "Who We Are"	+30	+30	+60	Most likely the brand casing in the large display text, the only text change in that section
Contact form section		+88	+88	Phone sentence and existing text

These earlier additions also still show in the comparison: the extra homepage section, the 15-service grid on the Services page, the blog category bar and longer mobile page banners. Blog pages are shorter than the original because 6 posts now show per page.

8. Originality

External plagiarism check: pending. Not run, and not passed. No 95% score can be claimed.

Internal duplicate check (internal only; it cannot see the web): 51 documents and 1,275 pairs were compared on shared 6-word phrases, after excluding 43 phrases found on 5 or more documents as shared page wording.

- Highest overlap: 6.3% (3 phrases), Contact and Home.
- Between any two articles or service pages: 2.0% or less.
- Repeated opening sentences: 0.
- Without the exclusion, the highest figure is 36%, between Contact and other pages, caused by shared page wording.

Content needing external verification

Check these with Copyscape, Grammarly or a similar service, ideally after launch.

1. The 5 new articles in section 4.
2. The 6 older posts.
3. The 15 service pages.
4. Home, About, Services, Products, Portfolio, Case Studies, Contact, Careers and Areas We Serve.
5. The 11 drafts, each before it is published.

9. Files modified

- **Migration:** `application/migrations/004_final_content_review.php`, `application/migrations/data/final_updates.php`, `application/config/migration.php`
- **Controllers:** `Blog.php`, `CaseStudies.php`, `Home.php`, `admin/Blog.php`
- **Main view edits:** `home/index.php`, `home/about.php`, `home/areas.php`, `careers/index.php`, `contact/index.php`, `partials/footer_widgets.php`, `services/detail.php`, `services/index.php`, `blog/_cards.php`, `blog/detail.php`, `home/_latest_posts.php`
- **Heading change only:** other views under `application/views/frontend/`, in `blog`, `careers`, `case-studies`, `partials`, `portfolio`, `products` and `services`
- **New images:** 7 `assets/images/blog/article-*.png` files, cropped from existing site images, with WebP copies
- **Database:** 5 posts published, service text corrected, alt text added, address updated. Corrections apply only where the original wording was still present

10. Remaining production issues

Priority	Issue	Action
High	Plagiarism check not done	Run the external check in section 8
High	Mobile, SEO and CRM unconfirmed	Confirm or unpublish
High	Image licences unconfirmed	Confirm the template and stock licences. `blog1-8.png` shows a FREEPIK watermark; no post uses it now, but it stays in the project and is named in the migration 003 data
High	Slow mobile loading (LCP 11.7–13.4 s)	Enable compression and re-measure on production
Medium	Six older posts are thin (114–135 words)	Expand them; they were kept as they are
Medium	Sample portfolio and case study content	Replace with real work when available
Medium	"14 Technologies" counter and logos; "we travel for meetings" and "details kept for future roles"	Confirm these are accurate
Medium	Gmail App Password was shared in chat	Rotate it
Medium	Rich Results Test and Search Console not run	Run after launch
Low	Lighthouse SEO 92: social icons without links	Add real LinkedIn and Facebook URLs, or remove the icons

11. Incidents in this round

- **Code backup failed.** The `tar` command misread the `E:` path and failed, and the first view edits ran anyway. No code backup exists from immediately before those edits. Available copies: `backups/before-seo-upgrade-2026-11-06/` and `backups/before-final-content-2026-11-06/project-code-after-view-edits.tar.gz`. The database backups are complete, including `girzock_technologies-immediately-before-migration.sql`.
- **Modified dates.** The alt-text update changed the modified date on the six older posts. The dates were restored from the backup and the migration was corrected.
- **Footer.** The new phone link made the footer 362 px taller at 768 px. Found by the comparison and fixed; the difference is now 34 px.
- **Live publishing order.** Migration 004 ran on the real database before the last small edits. The address line break was then applied by a guarded update, and the migration file was changed to match.

Appendix Z: Archive: SEO Audit (earlier pass)

> Superseded. Kept for history; the current appendices take precedence.

Date: 7 November 2026. Fresh read-only crawl of the local build.

> **Superseded.** This is an earlier snapshot. The current results are in `COMPLETE_SEO_SCORE_REPORT.md`, `COMPLETE_PAGE_INVENTORY.md` and `CONTENT_QUALITY_AUDIT.md` (7 November 2026). Since this report, LinkedIn and Facebook icons are hidden until real addresses are added, and the six short blog posts were rewritten with H2 sections.

Results

Check	Result	Status
URLs crawled	89, all HTTP 200	**PASS**
Indexable pages	62; 27 deliberately noindex (portfolio sample details, tag pages, search)	**PASS**
Sitemap	61 URLs, no noindex or broken entries, built on each request	**PASS**
Indexable but not in the sitemap	`/blog/page/2`, by design	**PASS**
Duplicate titles or descriptions	0 among indexable pages	**PASS**
One H1 per page	All pages	**PASS**
Canonical URL	On every page. The tag pagination mismatch is fixed	**PASS**
Open Graph and Twitter	On every page	**PASS**
Structured data	Valid JSON on every page: Organization, WebSite, WebPage or ContactPage, BreadcrumbList, Service (16), Product (6), BlogPosting (11), JobPosting (6)	**PASS**
robots.txt	Blocks admin, search and form endpoints, and names the sitemap	**PASS**
Legal pages	Added and in the sitemap	PASS, needs legal review
Empty blog category	Now noindex	**PASS**
Heading level skips	14 audit readings: six older posts have no H2 before the sidebar, and a counter on `/services` uses H4	**PARTIAL**
Product structured data	No offers or reviews, so Google product rich results may not apply. Do not invent them	**PARTIAL**
JobPosting	No `validThrough`. Confirm the vacancies are genuine	**PARTIAL**
Social profiles	LinkedIn and Facebook URLs empty	**PARTIAL**
Search Console, Analytics	Not configured	**NOT IMPLEMENTED**
Rich Results Test, live indexing	Need the public site	**NOT TESTED**

How SEO works when you publish a blog post

Sections 10 and 11 of the project report explain this step by step, with an example post. In short:

- **Filled automatically:** slug, canonical URL, BlogPosting data, Open Graph image, sitemap entry, breadcrumbs, related links.
- **Overrides:** SEO title, meta description, sharing image and indexing are optional fields on the post.
- **Manual:** submitting the sitemap and requesting indexing in Search Console.
- **Changing a slug** creates a 301 redirect automatically.

The popup and SEO

The popup is not in the page's main content. Its images are not in the HTML, and it opens after the page has loaded. Its form is the same enquiry form, so it adds no indexable content.

Appendix AA: Archive: SEO Upgrade (6 November)

> Superseded. Kept for history; the current appendices take precedence.

Completed 6 November 2026.

> **Superseded.** This is an earlier snapshot. The current results are in `COMPLETE_SEO_SCORE_REPORT.md`, `COMPLETE_PAGE_INVENTORY.md` and `CONTENT_QUALITY_AUDIT.md` (7 November 2026). Since this report, LinkedIn and Facebook icons are hidden until real addresses are added, and the six short blog posts were rewritten with H2 sections.

Summary

Item	Result
Enquiry delete	Done: trash icon on every row, confirmation, deleted without a reload
Pages with unique SEO	52 indexable pages, all with unique titles, descriptions and H1s
Services	15, each with a full page (417 to 615 words)
Blog articles drafted	16 drafts, 610 to 704 words each, none published
Sitemap	52 URLs, all live and indexable
Plagiarism check	**Pending: no checker was available**

Incident during this work

A test script was wrongly pointed at the real site for about a minute at 11:28 to 11:30 on 6 November. It created:

- 5 test enquiries (#2 to #6), 1 job application and its dummy resume
- 11 real emails through the configured Gmail account: 6 to girzock@gmail.com and 5 to @example.com addresses
- 4 failed login records and some rate-limit entries

Those records and the file were removed, matched by ID, address and time. Enquiry #1, the admin account and the SMTP settings were not changed. **The emails cannot be recalled:** expect 6 test notifications in the inbox, possibly with bounce messages. Enquiry numbers now continue from #7, because the database does not reuse numbers. All later tests ran against a separate database, and the test tools refuse to target the real site.

Decisions to review

Decision	Reason
"WordPress vs Custom" not drafted; "Domain, Hosting and SSL" and "Website or Mobile App" added	A published article already targets the WordPress question
No FAQ structured data	Google has retired FAQ rich results, so FAQs are visible content only
No separate city pages; one "Areas We Serve" page instead	Near-identical city pages risk being treated as doorway pages
Sample portfolio pages set to noindex	They show artwork rather than client work and are thin
Delete is permanent	As you asked. Archive and Restore remain on the enquiry page as the safe alternative
IT Consulting kept as a 15th service	It was existing business content

Local SEO terms targeted

Primary: software development company in Thisaiyanvilai; IT company in Thisaiyanvilai; website design company in Tirunelveli; software development company in Tirunelveli; web development services in Tirunelveli; SEO services in Tirunelveli; IT jobs in Tirunelveli.

Secondary, used only where relevant: digital solutions in Thoothukudi; digital transformation in Nagercoil; IT solutions provider in Kanyakumari; online presence in Thiruvananthapuram; e-commerce website development in Tamil Nadu; website development cost in Tamil Nadu.

The schema has one address (Thisaiyanvilai). Other places appear only as areas served.

Originality

Check	Result
Plagiarism or originality score	**Not checked. Verification is pending, so no score is claimed**
Internal duplicate check (38 documents, 703 pairs, shared 6-word phrases)	Highest overlap 2.1%, between two draft articles
Repeated opening sentences across drafts	None

The internal check only compares our own pages with each other and cannot see the web. Please run the drafts and service pages through a tool such as Copyscape or Grammarly before publishing.

Sources used in research

Facts stated in the content came from these sources. Local economic data was limited, so local detail is deliberately modest.

- Google: improve your local ranking (https://support.google.com/business/answer/7091?hl=en), guidelines for representing your business (https://support.google.com/business/answer/3038177?hl=en), service areas (https://support.google.com/business/answer/9157481?hl=en)
- web.dev: Web Vitals (https://web.dev/articles/vitals), LCP (https://web.dev/articles/lcp), INP (https://web.dev/articles/inp), CLS (https://web.dev/articles/cls)
- Google: changes to FAQ rich results (https://developers.google.com/search/blog/2023/08/howto-faq-changes)
- Thisayanvilai (https://en.wikipedia.org/wiki/Thisayanvilai), Economy of Thiruvananthapuram (https://en.wikipedia.org/wiki/Economy_of_Thiruvananthapuram), Business Standard on Thoothukudi (https://www.business-standard.com/industry/news/thoothukudi-1-trillion-investment-revival-story-125072501388_1.html)

Test results

Suite	Where it ran	Result
Public site, forms, security	Test database	107 of 107
Admin panel	Test database	291 of 291
SEO and enquiry delete, fresh run	Test database	168 of 170: see below
Same suite, after fixing those two	Test database	169 of 170: see below
Browser behaviour	Test database	53 of 54: see below
Enquiry delete in a browser, responsive pages	Test database	25 of 25
Crawl, sitemap, schema	Real site, GET only	128 of 128
Fresh install from SQL plus migrations	Test database	Passed

Failures explained:

- **About title length and "site:" check:** the first came from the admin suite resetting that title in the test copy, the second from my check matching the word "website:". Neither was a site fault, and both passed on the rerun.
- **"Role without permission" on the rerun:** the test user already existed from the first run, where this check passed.

- **Browser "9 services in mega menu":** the expectation predates the new services. The new visual test confirms 15.

After those runs, small changes were made to link text, the side-panel links and slider CSS loading. They were checked by a further browser check on the real site, a Lighthouse rerun and a page smoke test, not by rerunning the full suites.

Design comparison with the original

Compared at 1920, 1440, 1024, 768 and 375 px. Every difference found is a requested change: new H1 wording, added services, the homepage local section, the contact form's new service options and new footer links. The blog listing differs as before. One hidden heading was removed from the Services page.

Performance

Lighthouse on localhost, with compression off. Treat these as before-and-after comparisons, not as live-site scores.

Page	Measure	Before	After
Home, desktop	Performance	52	68
Home, desktop	LCP	5.1 s	2.6 s
Home, desktop	CLS	0.32	0.247
Home, desktop	Page weight	12,976 KiB	8,622 KiB
Home, mobile	Performance	51	40
Home, mobile	LCP	22.5 s	12.6 s
Home, mobile	Page weight	11,362 KiB	8,414 KiB
Home	SEO	83	92
Services, mobile	Performance	59	55
Services, mobile	LCP	17.0 s	13.2 s
Services, mobile	Page weight	4,167 KiB	2,917 KiB

Weight and LCP improved, but **the mobile Performance score fell on the two pages measured**, because Total Blocking Time rose in the final run (home 260 ms to 760 ms). That figure varied a lot between runs on this PC. Mobile performance is not solved, and a real measurement on the live server is needed.

Remaining issues

1. **Mobile speed:** LCP is still far above Google's 2.5 s target in this local test. Turning on compression should help: Lighthouse estimates 1,220 KiB of savings. The main stylesheet is 623 KB.
2. **Homepage layout shift:** CLS 0.247 on desktop exceeds the 0.1 target. The main cause is the hero text block moving as it loads. Fixing it may require changing how the hero animation works, so it was left for you to decide.
3. **SEO score 92:** the remaining flag is the "coming soon" LinkedIn and Facebook icons, which have no link. It clears once you add the real URLs in Website Settings.
4. **Structured data:** checked with my own parser. Google's Rich Results Test needs a public URL.
5. **Services with no profile checks:** Mobile App, SEO and CRM are listed because you asked. Please confirm the team can deliver them as described.

Before going live

1. Replace the Gmail App Password, and enter it again on the live server.
2. Review and publish the drafts, after running them through a plagiarism checker.
3. Set `APP_ENV=production`, the https `BASE_URL` and `COOKIE_SECURE=1`.
4. Run `php index.php setup migrate` on the live database.
5. Turn on `mod_deflate` and the HTTPS redirects.

6. Set up Search Console, the sitemap, GA4 and Google Business Profile: see the README.
7. Add LinkedIn and Facebook URLs, if you have them.

Files changed

New: `application/migrations/002_seo_fields_and_service_sections.php`, `003_seo_content.php`, `migrations/data/` (services, pages, blog_drafts), `views/frontend/home/areas.php`, `database/tools/build_webp.php`, `database/tools/minify_assets.js`, `docs/SEO_UPGRADE_REPORT.md`, `assets/*/*.min.*`, and `.webp` copies in `assets/images`.

Changed:

- Controllers: Home, Services, Products, Portfolio, CaseStudies, Blog, Careers, Contact, Sitemap, admin/Enquiries, admin/Services, admin/Seo
- Core and libraries: MY_Controller, MY_Model, Admin_Crud_Controller, Seo, Html_sanitizer
- Models: Settings, Service, Product, Portfolio, Blog, Enquiry
- Views: home, about, services, products, portfolio, case studies, careers, contact, layouts, nav, overlays, headers, footer, SEO partial, admin enquiries, admin form, admin SEO
- Other: `girzock_helper.php`, `routes.php`, `migration.php`, `.htaccess`, `README.md`, `admin.js`, `admin.css`, `girzock.js`, `girzock-dynamic.css`

Backups: `../backups/before-seo-upgrade-2026-11-06/`, holding the database and code from before this work.

Not changed: `.env`, `SECRET_BOX_KEY`, the SMTP settings and the existing images.

Appendix AB: Archive: Page Inventory (earlier pass)

> Superseded. Kept for history; the current appendices take precedence.

Date: 7 November 2026 **Sources:** the route list (`application/config/routes.php`), the database (read-only SELECT queries), the live sitemap (`/sitemap.xml`) and a crawl of the local site that follows every internal link from the homepage and the sitemap. Every number below was counted, not estimated.

Counts

What	Count
Unique public pages (each page once; pagination such as `/blog/page/2` is part of its listing, not a separate page)	**87**
... unique indexable pages	**61**
... unique noindex pages	26
Pagination URLs, not counted as pages	2
Public URLs found by the crawl, including pagination	89
... returning HTTP 200	89
... indexable (no `noindex`)	62
... `noindex` on purpose	27
URLs in the sitemap	61
Indexable URLs not in the sitemap	1 (`/blog/page/2`, a listing page; leaving it out is normal)
Sitemap URLs that are noindex, redirect or fail	0
Redirect-only addresses: 10 old `.html` pages (`/index.html`, `/index8.html`, `/about.html` and the like) and `/terms-and-conditions`	11, each checked and each returning 301 to its page
Non-page endpoints (`/sitemap.xml`, `/robots.txt`, `/search`, `/contact/submit`, `/careers/apply`)	5
Admin screens (sign-in required, never indexed)	40, listed below

Public pages by type

Type	Pages
Blog category	6
Blog category (noindex)	1
Blog listing page	1
Blog post	11
Blog tag (noindex)	13
Case study	3

Type	Pages
Core page	3
Home	1
Job opening	6
Legal	3
Listing	6
Portfolio item (noindex)	13
Product	6
Service	16

Noindex pages:

- **13 portfolio items** are sample concepts, not client work.
- **12 tag pages, plus one second page of a tag,** would only repeat category content.
- **1 category page** (Digital Marketing) has no published posts yet.

All of them are still reachable and keep `follow`, so links pass through them.

Content in the database that is not public

Content	By status
Services	16 active
Products	6 published
Portfolio	13 published
Case studies	3 published
Job openings	6 active
Blog posts	20 draft, 11 published

The 20 draft blog posts are not public and not in the sitemap. They can be published from **Admin** → **Blog** after review; the steps are in `BLOG_PUBLISHING_GUIDE.md`.

Every public URL

Columns:

- **Indexable:** whether the page allows search engines.
- **Canonical:** "Self" means the page names itself as the main address.
- **Words:** visible text, not counting the menu, footer, popup or loading screen.

- **Content status:** rated against the minimum for that page type, as described in `CONTENT_QUALITY_AUDIT.md`.
- **Schema:** the structured data types on the page.

The error page (any unknown address) returns a real 404 status, has `noindex` and uses the same header and footer.

Admin screens

These are under `/admin/`, require sign-in, send `noindex` and are blocked in `robots.txt`.

Area	Screens
Sign-in	Sign in; Forgot password; Reset password (from the emailed link); Change password (forced on first sign-in)
Dashboard	Dashboard; Search results
Enquiries	Enquiry list (filter, export); Enquiry detail (status, notes, assign, email log, resend)
Job applications	Application list; Application detail (resume download)
Services, Products, Portfolio, Case studies, Careers, Blog	For each of the 6: list, add, edit (18 screens)
Categories	Categories
Media Library	Library; Picker (used inside editors)
SEO Management	Page list and redirects; SEO editor for each fixed page

Area	Screens
Promotional Popup	Settings, images, previews, reset
Website Settings	Company details, social links, SMTP, test email
Admin users	User list; Add user; Edit user; Roles and permissions
Profile	Profile (its password change is the Change password screen above)

Counted as 40 screens. Each of the 6 content types has 3 screens, the fixed-page SEO editor counts once, and screens that only take a form post are excluded.

Appendix AC: Archive: Public Page Inventory (earlier pass)

> Superseded. Kept for history; the current appendices take precedence.
>
> **Superseded.** The current page list and counts are in `COMPLETE_PAGE_INVENTORY.md` (7 November 2026, final pass).

Generated on 7 November 2026 from a read-only crawl of `http://localhost/girzock-website/`. Every row is a URL the crawl fetched; none is assumed.

Totals

Measure	Count
URLs fetched by the crawl	89
HTTP 200	89
Indexable	62
Sitemap URLs	61
Fixed public pages	13 (Home, About, Services, Products, Portfolio, Case Studies, Blog, Careers, Contact, Areas We Serve, Privacy Policy, Terms and Conditions, Cookie Policy)
Dynamic detail templates	6 (service, product, portfolio, case study, blog post, career)
Live services records	16 of 16
Live products records	6 of 6
Live portfolio records	13 of 13
Live case-studies records	3 of 3
Live careers records	6 of 6
Live blog records	11 of 31
Blog drafts (not public, checked)	20

The crawl reaches the blog tags that are linked from pages. All 27 tag URLs and 7 category URLs were also requested directly, and every one returned 200.

System routes not in the table: `/search` (noindex), `/sitemap.xml`, `/robots.txt`, `/contact/submit` and `/careers/apply` (POST only), the 404 and 410 pages, and the old `.html` addresses (301).

Admin modules (15 in the sidebar)

Dashboard, Enquiries, Services, Products, Portfolio, Case Studies, Blog Management, Careers, Job Applications, Media Library, Categories, Promotional Popup, SEO Management, Admin Users and Website Settings. Sign-in and Profile are separate screens. Every admin URL sends a signed-out visitor to `/admin/login`.

Appendix AD: Archive: Regression Test Report (earlier pass)

> Superseded. Kept for history; the current appendices take precedence.

Date: 7 November 2026 **Build:** the local copy at `E:\Girzock Technologies\girzock website\girzock-website`, after the form speed, popup reappearance, social links and SEO changes **Live site:** nothing ran against `https://girzock.com`, and nothing has been deployed

Result

	Checks passed	Checks failed
Isolated test copy	3,080	0
Real local site, read-only	5,908	11
Total	**8,988**	**11**

The 11 failures are all one Firefox measurement, explained below. No functional failure remains.

The fresh-install check (2) and the timed form submissions (5 of 5) are listed in the table below but are not included in these totals. The heading-style comparison reports differences, not pass/fail checks.

How the tests were kept safe:

- **Isolated copy:**
- – its own database, `girzock_test`, built fresh from the install SQL and migrated to version 13;
- – PHP's built-in server on port 8096, with test keys in a separate private folder;
- – a local mail catcher on port 2525.
- – Every enquiry, upload, setting change and password reset happened only there.
- **Real local site:** GET requests only. Nothing was submitted and nobody signed in.

Before and after, real data unchanged:

- migration version 13;
- 2 enquiries (your own GZ-ENQ-2026-00007 and 00008);
- 0 job applications;
- 1 admin account, with the same password hash checksum;
- the same SMTP settings checksum and the same `.env` checksum;
- LinkedIn and Facebook still empty;
- no PHP errors logged today;
- no test uploads left behind;
- both test ports closed at the end.

Isolated test copy

Suite	What it covers	Passed	Failed
Fresh install	Install SQL then migrations: version 1 to 13. A second run changes nothing	2	0
Final content (`t8_final.php`)	Text, links and structure of every content page	813	0
Public site (`t1_public.php`)	Pages, forms, CSRF, honeypot, duplicates, emails, escaping, headers	107	0
Admin (`t2_admin.php`)	Sign-in, lockout, password reset, roles, CRUD, enquiries, email retry from the admin	291	0
SEO and delete (`t4_seo.php`)	Crawl of 89 URLs, metadata, schema, sitemap, drafts, preview, delete	183	0
Browser (`t3_browser.js`)	Homepage behaviour, the enquiry form through the real page, gallery, mobile, search	53	0

Suite	What it covers	Passed	Failed
Uploads (`t15_upload.php`)	Image upload checks, conversion, limits, PHP blocked	77	0
Forms and email (`t29_forms.php`)	All four enquiry forms, both emails, failures logged, double submit	108	0
Mega menu (`t16_mega.js`)	Menu at all widths	234	0
Heading styles (`t9_headings.js`)	1,176 headings compared, 0 differences	counted as 0 differences	—
Dropdown (`t37_dropdown.js`)	Service dropdown in three browsers, keyboard and touch	202	0
Favicon (`t47_favicon.php`)	Favicon priority	22	0
Popup admin (`t53_popup_admin.php`)	Settings, validation, images, toggle, reset, visitor reset, migration re-run	149	0
Popup in the browser (`t52_popup.js`)	All reappearance rules, layout at 6 laptop sizes, form, toast, keyboard	438	0
Email retry (`t63_retry.php`)	The retry job re-sends a send cut off 20 minutes ago, leaves one in progress alone, and never re-sends a sent email	6	0
Social links admin (`t61_social_admin.php`)	LinkedIn and Facebook fields, the URL checks, other settings untouched, icons on 20 page types	90	0
Social links appearance (`t62_social_visual.js`)	Four icons alike at 4 screen sizes in 3 browsers, hover, clicks, new tab	307	0
Form speed (`t59_speed.php`)	5 timed submissions with a mail server that takes 3 s per email: median 43 ms; all saved; both emails sent	5 of 5	0

Real local site, read-only

Suite	What it covers	Passed	Failed
Final content (`t8_final.php`)	As above, on the real data	813	0
SEO (`t4_seo.php`, read-only mode)	Metadata and schema on every page	141	0
Panel (`t7_panel.js`)	Contact panel	10	0
Mega menu	As above	234	0
Where We Work orbit (`t27_orbit.js`)	Animation and layout	113	0
Tabs (`t38_tabs.js`)	Tab heights and behaviour	766	0
Effects (`t40_effects.js`)	Outline text and the header button in three browsers	378	0
About and footer text (`t43_flow.js`)	Outline text position and spacing	1,281	11
Preloader, About, icons (`t46_pre.js`)	Loading screen and icons	762	0
WhatsApp button (`t48_whatsapp.js`)	Visibility by width, shake	438	0
Form fields (`t35_fields.js`)	Readable text in 48 fields, 0 too faint	48	0
Real popup (`t55_real_popup.js`)	The live popup settings on the real data	150	0
Footer social links (`t60_social.js`)	23 page types, three browsers, desktop, tablet and phone, real clicks	774	0

Two read-only checks are reported separately:

- **Crawl:** 89 URLs, all HTTP 200.
- **Homepage comparison:** 276 sections compared by name at 6 widths, light and dark. See below.

The 11 failures

All 11 are in Firefox, in the check "gap from 'Technologies' to ABOUT is 24 to 32 px". Firefox reported 49 to 91 px.

The cause is the test method, not the page. The test reads the text's height inside an SVG mask, and Firefox reports 0 for it. A separate pixel measurement, made earlier in this project, found the real gap is 33, 32 and 24 px in Firefox and 33, 31 and 25 px in Chrome. The same check passes in Chromium and WebKit. The failures are kept in the count because the test did report them.

Failures found during this work, and what was done

Found	Cause	Action
Email checks failed in the public, admin and forms suites (13 checks)	**Tests, not the site.** Emails are now sent after the reply, and the tests read the mail log at once	Tests now wait up to 15 s for the email results. All pass
Popup form had a 44 to 102 px scrollbar at every laptop size (18 checks)	**Real fault.** The closed, invisible service list took up space below the field	Fixed in `girzock.css`: in the popup the closed list is removed from the layout. Now no scroll at any size
Popup reappearance checks (3)	**Test setting.** The admin suite had raised the visitor reset number	The browser suite now sets it first
Popup toast "not in view" in Firefox and WebKit (2)	**Test timing.** Measured during the 0.3 s slide-in	The test waits for the slide to finish
Effects and flow tests could not find `#commitment`	**Your edit at 17:53:** you removed the "Our Commitment" section from `home/index.php`	Your edit is kept. The tests now check the footer outline text, and expect 2 outline texts instead of 3
Saving Settings changed `smtp_crypto` from None to TLS on the test copy (2 checks)	**Test fault.** The test's form reader skipped an empty selected value	Test fixed. The admin form itself was correct, and your real setting is TLS
The first clean run was invalid	**My mistake.** I started the suite without the mail catcher, and the earlier run kept running after I stopped it	Every leftover process was stopped and 6 stray test images (196 bytes each, unused) were removed. The run was then repeated cleanly

Homepage comparison

The 18:48 homepage was compared with a capture from 16:18 today, section by section at 425 to 1920 px, light and dark. No image changed, and there were no console errors or failed requests.

Section	Change	Reason
Our Commitment (`#commitment`)	Gone	Your edit at 17:53
About (`#about-girzock`)	−83 to +58 px	The paragraph now names the districts (content brief, migration 012)
Footer	+24 px at 768 px only	The Privacy, Terms and Cookies links
Custom software (`#custom-software-solutions`)	−25 to −52 px	**Not explained.** Its markup, text, images, CSS and scripts are unchanged since 16:25, and fonts were ruled out by blocking them. The tab layout suite passes. The 16:18 capture may have caught its animated heading mid-animation. Look at this section once in the browser

Lighthouse, mobile, local server

Page	Performance	SEO	Accessibility	Best practices	LCP	CLS
`/`	42	100	97	93	17.7 s	0.000
`/about`	59 (median of 3: 20, 59, 59)	100	97	96	17.3 s	0.003 (the first run measured 0.618)
`/services`	59	100	95	100	17.3 s	0.000
`/services/website-development`	60	100	100	100	16.5 s	0.000
`/areas-we-serve`	60	100	100	100	16.2 s	0.000
`/blog`	60	100	100	100	17.4 s	0.000
a blog post	60	100	100	100	16.7 s	0.000
`/contact`	56	100	100	100	16.9 s	0.003
`/products/customer-portal`	56	100	100	96	16.4 s	0.000
`/careers/web-developer`	56	100	96	100	16.2 s	0.000
`/privacy-policy`	56	100	100	100	15.5 s	0.000

These are local results without compression, under simulated slow mobile conditions. They are not production numbers.

Not tested

- **Anything on the live server:** HTTPS, the production headers and production email.
- **Real Safari and real phones:** WebKit and device emulation stood in.
- **The LinkedIn and Facebook profiles themselves:** no address exists yet.
- **Google's Rich Results Test and Search Console:** they need the public site.
- **External security scans.**

Appendix AE: Archive: Testing Report (earlier pass)

> Superseded. Kept for history; the current appendices take precedence.

Date: 7 November 2026. Only executed tests are listed.

- **Isolated:** a separate database (`girzock_test`) with its own private folder and fake keys. Emails go to a local mail catcher. Removed after each run.
- **Real:** read-only requests to the real local site.

Isolated copy (final run on the finished code)

Suite	Passed	Failed
Content checks	813	0
Public pages and forms	107	0
Admin modules	291	0
SEO, sitemap and delete	183	0
Browser behaviour	53	0
Image uploads	77	0
Forms and email	105	0
Mega menu	234	0
Service dropdown (Chrome, Firefox, WebKit)	202	0
Favicon priority	22	0
Popup admin	135	0
Popup browser (Chrome, Firefox, WebKit)	314	1
Heading styles compared	1,350	0 differences

The popup failure was a DNS outage on the PC ("Could not resolve hostname" for Google Fonts) during the WebKit run.

Real local site, read-only

Suite	Passed	Failed
Content checks	813	0
SEO crawl	141	0
Contact panel	10	0
Mega menu	234	0
Where We Work orbit	113	0
Software tabs	766	0
Header button and commitment text (3 engines)	378	0
Preloader, About layout, icons (3 engines)	762	0
WhatsApp button (3 engines)	438	0
Form fields readable in both themes	48	0
Popup after migration 011 (3 engines)	150	0
Page audit	62 pages: no broken images, no sideways scroll, no console errors	
Homepage comparison	368 sections: from 425 px up, only the requested sections changed, and no image changed. At 320 and 375 px, two runs of identical code differ the same way, so differences there are measurement noise	

Real email

- **SMTP sign-in:** verified without sending. Gmail answered 235 (signed in).
- **Delivery:** your own popup enquiry at 16:06 on 7 November 2026 produced the company notification and the client confirmation, both accepted by the SMTP server. Inbox arrival is for you to confirm.

Not tested

- Anything on the production server: HTTPS, compression, email from the server.
- Real Safari (WebKit was used) and real phones.
- External security scan, Rich Results Test and social sharing previews.

Earlier report corrections

- The "unlinked portfolio page" was an error in my crawler; the page is linked.
- Unused images are 90 (3.3 MB), not 480.
- Firefox's 11 "gap" failures in the 7 November afternoon run were a test method issue. A pixel measurement confirmed the same spacing as Chrome.

Appendix AF: Archive: Footer Social Link Audit (earlier pass)

> Superseded. Kept for history; the current appendices take precedence.

Date: 7 November 2026 **Scope:** the social icons in the footer of every public page, and their settings in **Admin → Website Settings → Social links**

Summary

Platform	Address on record	Shown in the footer	Tested
LinkedIn	none yet	Hidden until you save the address	The full path, tested on the isolated copy with a test-only address
Facebook	none yet	Hidden until you save the address	The full path, tested on the isolated copy with a test-only address
Instagram	https://www.instagram.com/girzocktechnologies/	Yes	Clicked on desktop, tablet and mobile in Chromium, Firefox and WebKit
WhatsApp	https://wa.me/916379362330	Yes	Clicked on desktop, tablet and mobile in Chromium, Firefox and WebKit

No LinkedIn or Facebook address was invented.

LinkedIn and Facebook are fully set up: their fields, checks, icons and markup all work. Each stays hidden until you paste your official company page address. The icon then appears in the footer of every page at once; no page files need editing.

How to add LinkedIn and Facebook

1. Sign in to the admin and open **Website Settings**.
2. In **Social links**, paste the addresses into **LinkedIn URL** and **Facebook URL**, for example `https://www.linkedin.com/company/your-page` and `https://www.facebook.com/your-page`.
3. Click **Save settings**.
4. Open any page and check the footer. There are four icons, in the order LinkedIn, Facebook, Instagram, WhatsApp.

To remove an icon, empty its field and save.

What the settings accept

An address is saved only if all of these are true:

- it starts with `https://`;
- it is on that platform's own domain:

Platform	Allowed domains
LinkedIn	`linkedin.com`, `www.linkedin.com`, or a country subdomain such as `in.linkedin.com`
Facebook	`facebook.com`, `www.facebook.com`, `m.facebook.com`, `fb.com`
Instagram	`instagram.com`, `www.instagram.com`
WhatsApp	`wa.me`, `api.whatsapp.com`, `chat.whatsapp.com`, `whatsapp.com`

- it points to a page, not just the site's home page;
- it has no user name, password or port in it;
- it is 255 characters or fewer.

Anything else is refused with a message that names the platform and shows an example, and nothing is saved. That includes `javascript:`, `data:`, `ftp:`, plain `http:`, other websites, look-alike domains such as `linkedin.com.evil.example`, and addresses without `https://`. Spaces before or after the address are removed.

The same check runs again whenever a page is drawn. If an unsafe value ever reached the database some other way, its icon is simply not shown. The Organization structured data (`sameAs`) uses the same checked list, without WhatsApp.

What every visible link has

Requirement	How it is met
Same look as the existing icons	The same markup and classes for all four, so size, border, radius, colours and hover come from the existing footer styles
Whole icon clickable	The link is the icon itself. Clicks near its edge were tested
Opens in a new tab	`target="_blank"`
Protects the site tab	`rel="noopener noreferrer"`. The new tab has no `window.opener`
Accessible name	`aria-label="GIRZOCK Technologies on LinkedIn (opens in a new tab)"`, and the same pattern for each platform. The icon itself is `aria-hidden`
Tooltip	`title` set to the platform name
No empty or # links	An icon appears only with a valid address

Same footer on every page

Every public page uses the homepage footer, with the tagline **"Technology. Growth. Elevate."**, the same social icons and the Privacy | Terms | Cookies links.

Test results

Test	Where	Browsers and screens	Result
`t60_social.js`: footer markup, tagline and real clicks with the current two icons	Local real site, GET only. 23 page types in Chromium (home, About, Services, a service, Products, a product, Portfolio, a portfolio item, Case studies, a case study, Blog, a post, a category, a tag, Careers, a job, Contact, Areas We Serve, Privacy, Terms, Cookies, the 404 page). Home and the three legal pages in Firefox and WebKit	Chromium, Firefox, WebKit; desktop 1366×768, tablet 820×1180, phone 390×844	**774 passed, 0 failed**
`t61_social_admin.php`: the admin fields and checks	Isolated copy	Signed-in admin over HTTP. Nine unsafe or wrong addresses refused; a valid save; the other settings untouched; four icons in order on 20 page types; `sameAs` markup; an unsafe stored value never drawn; emptying the fields hides the icons	**90 passed, 0 failed**
`t62_social_visual.js`: four icons, look and fit	Isolated copy, with test-only LinkedIn and Facebook addresses	Chromium, Firefox, WebKit at 1440×900, 1024×768, 820×1180 and 390×844. LinkedIn and Facebook have the same computed size, border, radius, colours and layout as Instagram and WhatsApp; one evenly spaced row; at least 24 px; no sideways scroll; the same hover style; a click near the icon's edge opens the profile in a new tab with no opener	**307 passed, 0 failed**

In every click test, requests to Instagram, WhatsApp, LinkedIn and Facebook were answered locally by the test. Nothing was sent to those services, and no WhatsApp chat was started.

The test addresses were used only in the isolated test database and were removed at the end. The real database still has no LinkedIn or Facebook address.

The tests prove the links are correct and open properly. They cannot prove the profiles are live, because the profiles were not contacted. After you add LinkedIn and Facebook, open all four once from a phone.

Files changed

File	Change
`application/helpers/girzock_helper.php`	New `valid_social_url()`: https only, the platform's own domain, a profile path, no credentials
`application/models/Settings_model.php`	New `public_socials()`, returning only valid profiles; `social_url()` uses it
`application/views/frontend/partials/social_icons.php`	Draws only valid profiles, with new-tab attributes and labels
`application/libraries/Seo.php`	Organization `sameAs` uses the checked list
`application/controllers/admin/Settings.php`	Validates each field with the platform check, with a clear error and an example
`application/views/admin/settings/index.php`	Section renamed **Social links**; fields labelled "LinkedIn URL", "Facebook URL", "Instagram URL" and "WhatsApp URL", each with an example address
`assets/js/girzock.js`	An old unused block that filled in "coming soon" icons was removed. No view uses `data-social` any more; this was checked before removing it

No database change was needed. The four platforms already existed in the `social_links` table.

Appendix AG: Archive: Premium Redesign

> Superseded. Kept for history; the current appendices take precedence.

Covers the "Final Professional Image Replacement, Blog & Case Study Redesign" and "Infinite Rotating Coverage Animation" briefs. Later design changes are in `FINAL_PRODUCTION_READINESS_REPORT.md`.

Images removed from pages

Case Studies VR gallery and video banner, purple and blank cards, pharmacy and retail images, older blog images. Their files remain on disk. The earlier Where We Work photos are now unused.

New images

All are in `assets/images/generated/pro/`, created with Figma image generation and encoded to WebP. Originals are in `backups/generated-pro-photos-originals-2026-11-06/`.

Folder	Used on	Count
`home/`	Homepage software tabs	5
`services/`	Service detail pages	15
`blog/`	Featured images for posts	10
`portfolio/`	Portfolio items	3
`cards/`	"Kinds of Projects" cards	16
`menu/`	Mega menu previews	15 files

The alt text for each image is stored in `application/migrations/data/professional_images.php`.

Redesign status

Page	Result
Case Studies	Image cards, labelled as sample concepts
Portfolio	New gallery; filter kept, lightbox removed
Blog listing	Featured post plus cards
Blog detail	Two columns, with sidebar: search, categories, recent posts, tags, call to action
Homepage software section	Five new tab images; layout later changed by the owner's request
Where We Work	Heading and three buttons on the left; rotating coverage orbit on the right; three coverage cards

Where We Work animation

Three rings rotate infinitely at 60 s, 42 s (reverse) and 28 s. The Base pin stays still. Reduced-motion is supported. Final test: 113 passed, 0 failed.

WebP and detail links

All 53 WebP files served during the final audit had the correct type. Detail links are covered by the crawl: 85 URLs, all HTTP 200.

Remaining approvals

- AI-generated people are not staff or clients and must not be presented as such. The cast is mixed international, in corporate settings.
- "Remote: Pan India & Global" was requested wording, and is broader than the page text about Tamil Nadu and nearby Kerala.
- "Work With" logos are the template's fictional companies, licence unconfirmed.
- Products, some Services cards (one shows an X shape) and About still use older template images.

- 20 draft posts use older images; two link to other drafts.
- Not tested: real Safari and real phones.

Appendix AH: Archive: Premium Upgrade

> Superseded. Kept for history; the current appendices take precedence.

Date: 6 November 2026. Site tested: `http://localhost/girzock-website/` (local XAMPP). The site is not public yet, so nothing that needs a public URL has been run.

Summary

- 16 realistic AI-generated service images are live in the mega menu and on the service pages.
- Digital Marketing is live as the 16th service.
- The Insights section is redesigned, and Work With Us shows its original images again.
- 9 new blog drafts are saved and unpublished.
- All automated tests pass (section 13).

Not cleared: the external plagiarism check has not been run, and mobile loading is slow.

Correction to the last report: `docs/VISUAL_UPGRADE_REPORT.md` said no image-generation tool was available. That was wrong. A Figma tool was available, but I had not checked for it. The report has been corrected.

Screenshots: only the developer reference image arrived with the brief. The Insights and Work With Us screenshots did not, so that work is based on the live sections and your backups.

1. Files modified

- **New:** `application/migrations/006_digital_marketing_and_photos.php`, `migrations/data/digital_marketing.php`, `assets/images/generated/photo/` (48 files), 9 sets of draft images in `assets/images/generated/blog/`, this report
- **Changed:** `application/config/migration.php`, `home/index.php`, `home/_latest_posts.php`, `home/areas.php`, `assets/css/girzock.css`, rebuilt `.min` files, `database/tools/build_illustrations.js`, `docs/VISUAL_UPGRADE_REPORT.md` (correction only)
- **Rebuilt with no intended change:** the earlier generated illustrations and industry icons, when the drawing script re-ran. The Builders icon was changed earlier and is unchanged here.
- **Database:** 1 service, 9 drafts, 1 category and their SEO rows added; service image references updated. Nothing deleted.

2. New images and page mapping

Generated with Figma's image generator (model `gpt-image-2.5-flare`), spending your Figma AI credits as you approved. You limited this to the service images, so 16 were generated. Figma did not report how many credits were used.

Each image appears in the mega menu and on its service page. Files are in `assets/images/generated/photo/menu/` and `photo/services/`, named after the service.

Service	Image
Website Development	Developer with a responsive site on monitor, tablet and phone
Custom Software	Developer at a dashboard and a code screen
Web Application	Browser-based application on a laptop
E-commerce	Shop owner with an online store, parcels and card reader
WordPress	Designer editing a page in a content management system
UI/UX Design	Designer with app prototypes and wireframe sketches
CRM	Team reviewing customers and a sales pipeline
Mobile Apps	Developer testing a phone app against a laptop design
Cloud	Engineer in a bright data centre aisle
AWS	Architect drawing infrastructure on glass; no AWS logo

Service	Image
API	Developer with linked systems around a hub
Maintenance	Support specialist with uptime and security screens
SEO	Analyst with search results and analytics
Digital Transformation	Owner moving from paper files to a workflow
IT Consulting	Consultant explaining a roadmap to an owner
Digital Marketing	Marketer with campaign charts and social posts

Please note:

- The people are AI-generated, not GIRZOCK staff. Don't present them as your team.
- The images have no readable text or logos by design. Small marks can still occur in AI output, so check them at full size. On-screen text was not checked letter by letter.
- Check that Figma's and the model's terms fit your commercial use.
- **Originals:** `backups/generated-service-photos-originals-2026-11-06/`. The Figma file "GIRZOCK service images" remains in your drafts.

Not realistic images: the Insights and article images, the case study images and the 9 new draft images remain vector illustrations, because you limited credits to the service images. They are labelled as illustrations in this report, not presented as realistic.

3. Image format and WebP results

Item	Result
Service images	48 WebP files, 2.3 MB in total: menu 812 × 380, page 912 × 1122 and 456 × 561
Quality	84, encoded with GD; each file's format was checked after saving
Largest file	90 KB (page image); largest menu image 54 KB
Older images	Kept on disk; none deleted
Upload pipeline	Unchanged; 77 of 77 upload tests pass

The 16 originals were PNG files from Figma, kept only in the backup folder. WebP is what the site uses.

4. Digital Marketing service

Live at `services/digital-marketing-services`, in these places: mega menu, Services listing, footer data, enquiry form, sitemap, admin, internal links (SEO service, Areas We Serve, home FAQ). It has its own SEO title and description, Service schema and breadcrumbs. Related services link both ways with SEO.

The page covers all 10 offerings, each with what it does and who it suits. It names Thisaiyanvilai, Tirunelveli, Thoothukudi, Nagercoil and Kanyakumari, and says there are no offices in the other towns. It makes no guarantees, certification claims, campaign results or "best" claims.

Needs your confirmation: I have no evidence of past digital marketing work. The page describes the service and claims no experience, as with Mobile, SEO and CRM.

Homepage card: the homepage core-services slider was not changed. Digital Marketing appears in the homepage menu, FAQ and enquiry form.

5. Mega menu

The menu now shows 16 services, 8 in each column, with Digital Marketing last. All 16 show their own image, title, description and link. The dark navy panel, layout and size are unchanged.

Tested on 17 pages (234 checks, on the isolated copy and the real site): hover, keyboard, touch, dark mode, failed image, active state and mobile menu. Desktop hover was tested at 1280, 1440 and 1920, and the mobile menu at 320 to 1024.

6. Service page images

All 16 service pages use their own realistic image, with descriptive alt text and responsive sizes. Checked at 375 and 1280: 32 of 32 correct on image, ratio, one H1 and no sideways scrolling. The final content suite also checks all 16.

The written content of the other 15 pages was not rewritten in this round. The earlier audit made it unique, and the duplicate check still shows low overlap (section 11).

7. Insights changes

- More space above: 40 px on desktop plus 100 px inside the panel, reducing on smaller screens.
- A light sky-blue panel with soft cyan and violet glows, and a dark version.
- A divider between the heading and the cards.
- Stronger card shadows and a larger hover lift, turned off for reduced motion.
- A publication date above each title. The date overflowed the curved category label, so it sits in the card text.

The heading is unchanged. The section is 145–178 px taller, as expected from the extra space. All three cards load at every tested width. They fade in as they scroll into view, about 1.5 seconds after a jump to the section.

8. Work With Us

Restored, with one deliberate difference you approved. The six original images (`brand1–brand6.png`) are back in their original order and slider, recovered from `backups/girzock-website-static-2026-11-05/`. Technology logos are gone from this section and remain in the separate technology slider elsewhere on the homepage. The heading stays "Work With GIRZOCK...", as you chose.

Important: your original site's own code comment says these are the template's sample companies, not partners: Minimize Interior, Nordyne, Metriks, QUO, Vintage Studio and Agrimax. They look like real client logos. Replace them with real ones when you can. **Their licence is not confirmed**, as they came with the template.

9. Blog drafts created: 9, none published

Draft	Words	Search intent
Digital Marketing Strategies for Small Businesses in Tirunelveli	636	Planning
Why Local SEO Matters for Businesses in Thisaiyanvilai	636	Local, why it matters
How Social Media Marketing Helps Local Businesses Grow	619	Channel
SEO vs Paid Advertising: Which Is Right for Your Business?	597	Comparison
How to Improve Google Search Visibility for a Local Business	594	Step-by-step fixes
Digital Marketing Checklist for Small Businesses in Tamil Nadu	557	Checklist
Website and Digital Marketing: Why Both Matter	625	Website and marketing together
How to Choose a Digital Marketing Service Provider in Tirunelveli	609	Choosing a provider
Common Digital Marketing Mistakes Small Businesses Should Avoid	580	Mistakes

Left out: "How Businesses in Thoothukudi Can Improve Their Online Presence", because it overlaps two existing drafts on Thoothukudi and online presence.

Each has its own SEO title and description, FAQs, service links, a call to action and a topic-specific illustration. There are no statistics or case studies, and examples are marked as illustrations where one is used. **Before publishing:** two drafts link to other drafts (visibility to local SEO, mistakes to checklist), so publish the target first or remove the link. Check the factual statements about Google's policies too; only the local ranking factors were checked against Google's help page in this round.

10. SEO keyword research

Limit: two more searches, mostly agency pages and promotional blogs, on top of last round's three. No keyword tool was available, so **search volumes were not measured**. Competitors' sites were not read in depth, and nothing was copied.

Seen in results for Tirunelveli digital marketing (unverified): Advetri, OwlClaw, BizAdda360, BG Digitz, Digital SEO, Versa Forge.

What this suggests:

- Many pages rely on "best" or "top" wording and promotional posts. Some show self-reported results.
- Plain guidance on choosing a provider and on what marketing can't promise looks like an opening.
- No Thisaiyanvilai-based digital marketing firm appeared. That is a possible opening, not proof that none exists.

Target search	Where it is used
Digital marketing services in Tirunelveli	Digital Marketing title and focus keyword
Digital marketing company in Thisaiyanvilai	Digital Marketing page, in natural wording
SEO services in Tirunelveli	SEO page
Local SEO in Tamil Nadu and Thisaiyanvilai	SEO page, Local SEO draft
Social media marketing	Digital Marketing page and draft; Tirunelveli named on the page
Marketing for small businesses	Two drafts
Thoothukudi, Nagercoil, Kanyakumari	Named on the service page and Areas page; no duplicate city pages

Local strategy: verify a Google Business Profile, keep business details consistent, gather genuine reviews and publish the drafts gradually. Google says local results depend mainly on relevance, distance and prominence, and nobody can promise rankings.

11. Duplicate-content audit

Check	Result
Duplicate titles, descriptions, H1s	None across 60 indexable pages
Internal duplicate check, 61 documents and 1,830 pairs	Highest 6.3% (3 phrases, Contact and Home); between articles, drafts and services 2% or less
Repeated opening sentences	0
Spell-check of pages, new service and drafts	Only valid words flagged, such as Pongal and Deepavali
Listed demo text, keyword-stuffing check	No demo text found. Stuffing was reviewed by reading the new content only

This is an internal check. It can't detect copied competitor text.

Thin content still open: six older posts have only 114–135 words. No older content was rewritten in this round.

12. External plagiarism verification

Pending. Not run and not passed. No external checker was available, so no 95% figure can be claimed. Check all public content and the 9 new drafts before publishing.

13. Responsive and test results

Tests that write data ran only on an isolated copy. The real site received read-only requests and migration 006.

Suite	Where	Result
Fresh install through migration 006	Isolated	Passed; second run changes nothing
Public	Isolated	107 passed, 0 failed

Suite	Where	Result
Admin	Isolated	291 passed, 0 failed
SEO and delete	Isolated	181 passed, 0 failed
Browser	Isolated	54 passed, 0 failed
Uploads	Isolated	77 passed, 0 failed
Mega menu	Isolated and real	234 passed, 0 failed on each
Content and images	Isolated and real	770 passed, 0 failed on each
Read-only crawl	Real	139 passed, 0 failed; 86 pages, 58 sitemap URLs
Admin panel click test	Real	10 passed, 0 failed
Heading styles	Isolated	1,362 compared, 0 differences

Homepage against a fresh baseline (7 widths, light and dark; 1280 was not in that baseline):

- Images changed only in the mega menu and Work With Us.
- Section heights changed only in Insights and the home FAQ (+30 px at 320 and 768, from the extra words). Sections below move down accordingly.
- Text changed only in the FAQ, Insights, the enquiry form's service list and the hero counter mid-animation.
- No sideways scrolling, failed requests or script errors.

Other width checks: Insights and Work With Us were checked at 320, 375, 425, 768, 1024, 1280, 1440 and 1920, with no sideways scrolling. Screenshots were reviewed at 1440 (light and dark) and 375, plus the service page and menu.

Tests caught three bugs of mine, all fixed before going live: a missing Digital Marketing menu image, stray markup from a Work With Us edit, and the date overflow.

14. Performance

Lighthouse, mobile, local server, two runs each:

Page	Performance	LCP	Page weight
Home	39, 36	12.5 s, 12.4 s	8.19 MB
Digital Marketing	60, 41	12.0 s, 12.5 s	2.53 MB
Article	60, 60	13.4 s, 13.1 s	2.48 MB

CLS stayed below 0.05 on all three, and accessibility stayed at 94–96. **Slow loading is still a real problem:** LCP is far above Google's 2.5 s target. Home scored 53 before the last two rounds of work. Its weight hasn't risen and blocking time swings between runs, but I can't rule out a slowdown. Compression is off locally, so re-measure on production.

Only one menu preview loads with each page, and the others load on hover.

15. Backups and integrity

`backups/before-premium-upgrade-2026-11-06/`, taken before any change:

File	Size	Check
`project-code.tar.gz`	99.3 MB	Archive listed in full without errors
`girzock_technologies.sql`	245,551 bytes	Dump complete, 28 tables
`girzock_technologies-immediately-before-migration.sql`	245,551 bytes	28 tables

These backups were not test-restored. Real data after migration: admin password hash, SMTP settings and `.env` are unchanged (checksums compared), with 0 enquiries, 0 applications and 3 uploads, as before. Published article dates and content are unchanged. No PHP errors were logged on the real site during this work. Your Git repository was not touched by me, and nothing was committed.

16. Remaining issues

Priority	Issue	Action
High	Plagiarism check not run	Run an external checker
High	Slow mobile loading (LCP about 12–13 s)	Enable compression, re-measure on production
High	Work With Us shows fictional company logos, licence unconfirmed	Replace with real logos, or confirm the licence
High	Digital Marketing, Mobile, SEO and CRM experience unconfirmed	Confirm, or unpublish
High	Other template and stock image licences unconfirmed; `blog1-8.png` has a watermark and remains in the project	Confirm, or replace
Medium	AI-generated people could be mistaken for staff	Don't use them as team photos
Medium	Insights, article, case study and draft images are still vector	Generate realistic images if you approve more credits
Medium	Six older posts are thin; sample portfolio and case studies remain	Expand them; replace with real work
Medium	Review the 9 drafts and 11 older drafts	Publish only after your review
Medium	Gmail App Password was shared in chat	Rotate it
Low	Rich Results Test, Search Console and WebP sharing images unverified	Check after launch

Appendix AI: Archive: Visual Upgrade

> Superseded. Kept for history; the current appendices take precedence.

Date: 6 November 2026. Site tested: `http://localhost/girzock-website/` (local XAMPP). The site is not public yet, so nothing that needs a public URL has been run.

1. Summary

- The services mega menu now works on all public pages, using one shared menu.
- 29 original illustrations and 26 unique gradient icons are live.
- Every new upload is now stored as WebP, or refused with a clear message.
- All automated tests pass (section 10).

Still open: the plagiarism check has not been run, and mobile loading is slow (section 12).

The brief referred to uploaded screenshots, but none arrived with the message. The work was based on the live sections you named.

2. Homepage

The brief said the homepage must not change, yet it also asked for changes to three things that appear there. I changed only those three:

Changed on the homepage	What changed
Services mega menu	New preview image for each of the 15 services
Technology for Local Businesses	26 unique icons and a small hover lift, at the same 30 px size
Insights	New images on the 3 article cards

Comparison with a baseline taken before any change: 14 captures (7 widths, light and dark).

- Same section positions and sizes, page height, fonts, colours and text. No sideways scrolling and no failed requests.
- The only image paths that differ are the three items above.
- The checker flagged 2 differences, both in the hero text. Both were the counter caught mid-animation (`7+` against `8+`).
- This compared measurements and image paths, not pixel-by-pixel images. I also reviewed the changed sections by eye at 1440.

Hero, sliders, service sections and other homepage images were not touched and not converted. Invisible changes: a body class and responsive image attributes on the Insights cards.

3. Mega menu

Root cause: there was no broken path or missing script. `nav.php` only rendered the mega menu when `$is_home` was true, so subpages got a plain dropdown. All its CSS was also limited to the homepage.

Fix: one shared menu for every page, in `partials/nav.php`, and the styling now applies site-wide. The mobile menu also uses one list of services everywhere.

Tested on 16 pages: Home, About, Services, 2 service pages, Products, Case Studies, a case study, Portfolio, Blog, Blog page 2, an article, Careers, Contact, Areas We Serve and the 404 page.

Check	Result
Opens on hover, stays inside the window, sits above page content	Passed on all 16 pages
Same panel background and size on every page	Passed
Each of the 15 services shows its own image, title, description and link	Passed on 4 page types
Keyboard: focus opens, Tab updates the preview, Escape closes and returns focus	Passed
Touch: first tap opens without leaving the page	Passed

Check	Result
Active state on service pages; dark mode	Passed
Failed image: keeps the last good picture, title still updates, no script error	Passed
Mobile menu lists 15 services at 320, 375, 425, 768 and 1024	Passed
No more than 1 preview image loads with the page; others load on hover	Passed

Desktop hover was tested at 1366, 1440 and 1920. Widths between 1025 and 1365 were not hover-tested, and the phone and tablet menu was tested at 1024 and below.

4. Images

All artwork is original. It is drawn from code by `database/tools/build_illustrations.js` and rendered to WebP through Chrome. **Correction:** this report originally said no image-generation tool was available. That was wrong: a Figma tool was available but had not been checked. See `docs/PREMIUM_UPGRADE_REPORT.md`.

- **Style:** polished vector illustrations with soft depth, not photorealistic 3D.
- **Clean:** no stock images, watermarks, brand logos or sentences of text. The only symbols are `</>`, `{ }`, VS and ₹.

Group	Scenes	Files	Size
Services: mega menu	15	15	812 × 380
Services: service pages	same 15 scenes, reframed	30	912 × 1122, 456 × 561
Published articles	11	33	1200 × 900, 800, 420 wide
Case studies	3	9	1200 × 900, 800, 420 wide
Total	**29 scenes**	**87 WebP, 1.8 MB**	Largest file 38 KB

Generated images use WebP quality 84.

Mapping

Service files are `assets/images/generated/menu/<service>.webp` and `services/<service>.webp`.

Service	Scene
Website Development	Responsive browser and phone, code panel
Custom Software	Dashboard connected to system modules
Web Application	Browser dashboard, secure sign-in
E-commerce	Product grid, cart, payment card
WordPress	Content editor with page blocks; no WordPress logo
UI/UX Design	Wireframe to finished screen, colour palette
CRM	Customer list, sales funnel, analytics
Mobile Apps	Two phones with app interfaces
Cloud	Cloud linked to three server racks
AWS	Layered cloud infrastructure; no AWS logo
API	Dashboard, table and phone linked through an API hub
Maintenance	Monitoring screen, shield, gear
SEO	Search bar, rising charts, magnifier
Digital Transformation	Table becoming an automated workflow
IT Consulting	Two people, plan on a screen, roadmap

Published article	Image (`generated/blog/`)
How to plan a business website that generates enquiries	`plan-business-website`
Custom software or off-the-shelf	`custom-or-off-the-shelf`
What to check before moving to the cloud	`cloud-migration-checklist`
UI/UX basics	`ux-basics`

Case study	Image (`generated/case-studies/`)
Taking a Local Retailer Online	`local-retailer-online`
Replacing Spreadsheets with Custom Software	`spreadsheets-to-software`
Moving a Business Application to AWS	`application-to-aws`

Case studies stay labelled as concepts. The alt text says so, and the detail page adds "Concept illustration, not a client photograph or project screenshot." No clients, metrics or results were added.

Layout notes:

- Service images display at the same 456 × 561 px as before and scale down on phones.
- Article image `width` and `height` now match the real ratio, which avoids layout shift.
- A dark-mode template rule was washing out images in the service and case study layout; it is now limited to the logo.
- The Services listing cards keep their older images, so that page looks unchanged.

Icons

26 custom SVG files in `assets/images/industry/`, one per category. The tests confirm that the artwork is different for each, and that each has a gradient and a title. They use a blue, cyan and violet gradient, and the lift on hover turns off for people who prefer reduced motion. The adjacent label is the accessible name, so the image `alt` is empty to avoid reading it twice.

5. WebP pipeline

Implemented in `application/libraries/Media_manager.php`. Every admin upload route uses it: blog, services, case studies, media library, settings and profile.

1. Checks the real file content, the extension and the image dimensions (up to 8000 px).
2. Refuses animated images, and images too large for available memory.
3. Re-encodes as WebP at quality 82, up to 2000 px wide, keeping the aspect ratio and transparency.
4. Makes copies at 1200, 800 and 420 px wide when the image is larger than that.
5. Confirms the output is really WebP, then saves a random filename and the WebP path.
6. If anything fails, removes partial files and shows an error. The original is **no longer** stored as a fallback.

Deleting a file from the media library also removes its copies.

Engine: this server has GD with WebP support, and that is the path tested. Imagick is preferred when present, but it isn't installed here, so **the Imagick code has not been run**. If neither is available, the upload is refused with a message naming the requirement.

Upload test results (isolated copy): 77 passed, 0 failed

Upload	Result
PNG 2400 wide with transparency	WebP at 2000 wide, 3 copies, transparency kept
JPG, static GIF, WebP, tiny PNG	Real WebP, correct size, right copies, served as `image/webp`
Image with PHP code appended	Code removed by re-encoding

Upload	Result
Corrupt PNG, animated GIF, 9000 px image, fake PNG, SVG	Refused with a clear message, no files or records left, panel still works
Corrupt file on an article edit form	Save stopped with a message; existing image kept and still shown
New article image	Saved as WebP and shown on the article with responsive sizes

The animated-GIF test caught a real bug in my first version, which was fixed. Uploads were not tested on the real site, to avoid leaving test files there.

Existing images

Nothing was deleted, and nothing on the homepage was converted. Earlier files are still on disk, including replaced service and article images.

Conversion candidates (not done): the Services listing cards, 6 product images, the portfolio images and the 11 draft articles. Give each draft its own image before publishing it.

6. SEO research

Limit of this research: three web searches, mostly returning directories and listing pages. I did not read competitors' own websites in depth, so treat this as a starting point. Nothing was copied.

Firms that appeared in results for Tirunelveli (from directories, unverified): Guru Software Solution, Olympods, LogixWeb, UNIQ Technologies, SKR Websites, Surfersway, Maz Software Solutions, Jaz Infotech, Bravery Infotech, Consign IT, 4S Technologies, Neemtec, Zervia Tech Solutions.

What this suggests:

- **Positioning:** listings mostly name a broad service list (web design, hosting, SEO, apps), with little explanation.
- **Thisaiyanvilai:** no firm in the town itself appeared. That is a possible opening, not proof that none exists.
- **Content gap:** results for cost questions were India-wide guides, with no local rates for Nagercoil or Thoothukudi. Your cost and provider-selection articles address this kind of question.
- **Next step with most value:** a verified Google Business Profile and consistent local listings.

Keyword map

Existing titles already target these terms naturally, so **no SEO titles were changed**.

Page	Primary term
Home	software development company in Thisaiyanvilai
About	IT company in Thisaiyanvilai
Services	web development services in Tirunelveli
Website Development	website design company in Tirunelveli
Custom Software	software development company in Tirunelveli
E-commerce	e-commerce website development Tamil Nadu
WordPress	WordPress website development
CRM	CRM software for small business
Cloud	cloud computing solutions
IT Consulting	IT consulting services
Areas We Serve	IT services in Tirunelveli and nearby districts

Search volumes were not measured, as no keyword tool was available. No new city pages were created, and the existing Areas page covers the secondary locations.

7. Duplicate and copyright audit

Check	Result
Duplicate titles, descriptions, H1s	None across 58 indexable pages
Internal duplicate check, 51 documents	Highest 6.3% (3 phrases, Contact and Home); between articles and services 2% or less
Repeated opening sentences	0
Listed demo text and placeholders in the audited pages	None found
Star ratings or review claims	None; a star motif in one new image was removed before publishing

External plagiarism check: pending. Not run and not passed. No 95% figure can be claimed. Whether any text matches competitor sites can only be answered by an external checker.

Licensing

- **New artwork:** original to this project.
- **Still needs your confirmation:** template and stock images remaining on the Services listing, Products, Portfolio and homepage. One Services listing image shows a person beside an X logo (`service6-5.png`).
- **Watermark:** `blog1-8.png` shows a FREEPIK watermark. No live page uses it, but the file remains in the project and in the older migration data.
- **Technology logos:** homepage logos for AWS, PHP and others are trademarks of their owners. Check that their use fits each brand's guidelines.

8. Technical SEO

Read-only crawl of the real site: 84 pages crawled, 58 indexable, 57 URLs in the sitemap, no broken links, drafts excluded, 134 checks passed.

Every audited page passed for one H1, canonical URL, Open Graph, image `alt` attributes and valid structured data. All 15 service pages have Service schema and breadcrumbs.

To check at launch: service and article sharing images are now WebP, which some social platforms may not display. Test with their sharing debuggers. Rich Results Test and Search Console also need a public URL.

9. Responsive and dark mode

Width	Homepage comparison	Service, case study and article images	Phone/tablet menu	Desktop hover
320, 375, 425, 768	Passed	Passed	Passed	n/a
1024	Passed	Passed	Passed	n/a
1440	Passed	Passed	n/a	Passed
1920	Passed	Passed	n/a	Passed

No page in these checks has sideways scrolling or failed images. Dark mode was tested for the homepage comparison, the panel and service images.

10. Test results (final code)

Tests that write data ran only on an isolated copy. The real site received read-only requests and migration 005.

Suite	Where	Result
Fresh install through migration 005	Isolated	Passed; second run changes nothing
Public	Isolated	107 passed, 0 failed
Admin	Isolated	291 passed, 0 failed

Suite	Where	Result
SEO and delete	Isolated	176 passed, 0 failed
Browser	Isolated	54 passed, 0 failed
Uploads (new)	Isolated	77 passed, 0 failed
Mega menu (new)	Isolated and real	224 passed, 0 failed on each
Content and images	Isolated and real	713 passed, 0 failed on each
Read-only crawl	Real	134 passed, 0 failed
Admin panel click test	Real	10 passed, 0 failed
Heading styles	Isolated	1,356 compared, 0 differences

Real data after migration: admin password hash, SMTP settings and `.env` are unchanged (checksums compared), with 0 enquiries, 0 applications and 3 uploads, as before. Modified dates did not change. No PHP errors were logged on the real site after 11:29, before this work began. The test environment has been removed.

Backups: `backups/before-visual-upgrade-2026-11-06/` holds the database and code, and both were verified before any change.

11. Performance

Lighthouse, mobile, local server. Three repeat runs on Home and the article:

Page	Performance	LCP	Before this work
Home	34, 47, 48	12.6 s	53, LCP 12.6 s
Article	49, 52, 59	12.0 s	60, LCP 13.4 s

One run each: Service 59 (LCP 11.7 s, previously 60), Case study 53 (LCP 12.0 s).

Home page weight is identical (8.22 MB), and the score swings with blocking time between runs (120–1,210 ms). That looks like measurement noise, but I can't rule out a small slowdown from these figures. CLS stayed low, at 0.043 or below on all four pages. LCP is far above Google's 2.5 s target; compression is off locally, so re-measure on production.

12. Remaining issues

Priority	Issue	Action
High	Plagiarism check not run	Run an external checker on all public content
High	Slow mobile loading (LCP about 12 s)	Enable compression and re-measure on production
High	Template and stock image licences unconfirmed	Confirm, or replace them
High	Mobile, SEO and CRM services unconfirmed (earlier audit)	Confirm or unpublish
Medium	Drafts still use older images	Give each one its own image before publishing
Medium	Sample portfolio and case study content; six short older posts (114–135 words)	Replace with real work; expand
Medium	Imagick path untested	Test one upload if production uses Imagick
Medium	WebP sharing images	Check after launch
Medium	Gmail App Password was shared in chat	Rotate it
Low	Animated GIFs and animated WebP are now refused	Upload a still image instead

13. Files modified

- **New:** `application/migrations/005_visual_upgrade.php`, `migrations/data/visual_upgrade.php`, `database/tools/build_illustrations.js`, `assets/images/generated/` (87 files), `assets/images/industry/` (26 files)
- **Upload and helpers:** `application/libraries/Media_manager.php`, the helper holding `media_url()` (adds `media_srcset()`), `application/config/migration.php`

- **Controllers:** `Services.php`, `admin/Services.php`, `admin/CaseStudies.php`, `admin/Media.php`
- **Views:** `layouts/main.php`, `partials/nav.php`, `partials/overlays.php`, `home/index.php`, `home/_latest_posts.php`, `services/detail.php`, `blog/_cards.php`, `blog/detail.php`, `case-studies/detail.php`, `case-studies/_lead.php`
- **Assets:** `girzock.css`, `girzock-dynamic.css`, `girzock.js`, and rebuilt `.min` files

Database: added `services.detail_image`, `services.detail_image_alt` and `case_studies.image_alt`; updated image references. Uploaded images and drafts were left alone.

Appendix AJ: Archive: Final Visual Report

> Superseded. Kept for history; the current appendices take precedence.

Date: 6 November 2026. Site tested: `http://localhost/girzock-website/` (local XAMPP). The site is not public yet.

Summary

- Published articles, case studies, portfolio items and Where We Work now use realistic, topic-specific images.
- Where We Work is redesigned, and the service page FAQs are fixed.
- Automated suites pass, with one explained exception (section 8).

Screenshots: none arrived with this brief, so the work is based on the live pages.

Still open: see section 10, including the plagiarism check and slow mobile loading.

1. Files changed

- **New:** `application/migrations/007_realistic_content_images.php`, `migrations/data/realistic_images.php`, 74 WebP files under `assets/images/generated/photo/`, this report
- **Views:** `home/index.php` (Where We Work only), `services/detail.php` (FAQ class), `portfolio/_gallery.php`, `portfolio/detail.php`, `case-studies/detail.php`
- **Styles:** `assets/css/girzock.css`, `girzock-dynamic.css`, rebuilt `.min` files
- **Config:** `application/config/migration.php`
- **Database:** image paths and alt text only. Article text and dates were confirmed unchanged by checksum

2. Images generated and replaced

30 new images were generated with Figma (`gpt-image-2.5-flare`), using your Figma AI credits. Figma did not report the credits used. With the earlier 16, there are 46 realistic images on the site.

The 16 service images were already realistic, so they were kept and no credits were spent replacing them. All 16 are confirmed in the mega menu and on service pages.

Published articles (`generated/photo/blog/`)

Article	Image
How to plan a business website	Owner and planner reviewing layouts and an enquiry form
Custom software or off-the-shelf	Manager with a boxed product beside a tailored dashboard
Moving to the cloud	IT manager with a checklist and a cloud upload on a tablet, beside server racks
UI/UX basics	Owner testing a phone app while a designer takes notes
WordPress or custom-built	Developer comparing a visual editor with hand-written code
First step in digital transformation	Colleagues moving a paper register onto a laptop
Why small businesses need a website	Shop owner holding up a phone showing a business website
Choosing a web development company	Owner taking notes as a developer explains designs
Website development cost	Planning desk with plan options, calculator and rupee notes
E-commerce for growing businesses	Team packing a parcel and checking orders
Maintenance and security	Engineer checking backups and security updates

The same image is used for social sharing, through the existing featured-image setting.

Case studies (`generated/photo/case-studies/`), all labelled as concepts

Case study	Image
Taking a Local Retailer Online	Online store on a laptop and tablet
Replacing Spreadsheets with Custom Software	Paper spreadsheet beside a dashboard
Moving a Business Application to AWS	Server migrating to the cloud on a monitor; no AWS logo

Portfolio (`generated/photo/portfolio/`), all labelled as concepts

Item	Image
Business website	Small business site on a desktop monitor
Web application	Task board app on a laptop
Online store	Checkout on a phone, with a payment card
Customer portal	Customer using an account portal on a tablet
Product catalogue	Hardware catalogue on a tablet, with tools
WordPress website	Person adding an image in a content editor
Landing page	Landing page on a phone, laptop behind
Storefront redesign	Designer comparing old and new layouts
Admin dashboard	Tables and charts on an ultrawide monitor
Online Store for a Local Retailer	Shopkeeper checking orders on a counter tablet
Custom Business Management System	Administrator with customers, jobs and invoices
Cloud Application Migration	Engineers watching a migration plan on a wall display
Corporate Website Development	Corporate site on a meeting room display

Portfolio detail pages and case study pages state "Concept image, not a client photograph or project screenshot." No clients, logos, metrics or results were added. The four named portfolio items keep their "Concept" labels.

Where We Work (`generated/photo/where-we-work/`)

Card	Image
Thisaiyanvilai & Tirunelveli	Developer talking with a local business owner in person
Thoothukudi, Nagercoil & Kanyakumari	Coordinator on a video call beside a project timeline
Thiruvananthapuram & Beyond	Developer delivering a finished site from a laptop

Please note:

- The people are AI-generated, not GIRZOCK staff or clients.
- Images were reviewed at contact-sheet size and on sample pages for stray text or logos, not each one at full size. Screens may show tiny unreadable marks.
- Check that Figma's and the model's terms fit your commercial use.

3. Where We Work design

- A light sky-blue gradient panel with cyan and violet overlays, and a soft dot pattern. No map or location pins, to avoid inaccurate location claims.
- Three rounded cards with thin gradient borders, soft shadows, a gentle hover lift and a photo at the top.
- Each card has a tag, heading, the original text and links, and three short points.
- It says "We have no offices here" for the regional card and "No office here, only online support" for Thiruvananthapuram. Only Thisaiyanvilai and Tirunelveli are shown as your home area.
- A dark version is included. Reviewed at 1440 in light and dark, and at 375.

The section is 506–1448 px taller than before, depending on width, because the cards now have images and bullet points. No other homepage section changed height.

4. FAQ fixes (all 16 service pages)

Issue	Before	After
Space above the label, desktop	0 px, against the panel edge	72 px
Decorative image above the heading on phones and tablets	326–783 px	Removed below 992 px
Heading size and wrap, desktop	55 px, 3–4 lines	44 px max, 2 lines
Label to heading	11–21 px, varied	18 px at every width
Heading to questions	45 px	32 px
Space to the next section	Tight	72 px desktop, 48 px on phones and tablets

The label is "FAQ" and the heading is "Questions About [service]". The decorative graphic no longer overlaps at any tested width. Accordion behaviour is unchanged. The change uses its own class, so the homepage FAQ isn't affected.

Other detail pages: case study, portfolio and product detail pages have no FAQ section to fix. Article FAQs are ordinary headings within the text, so they were left alone. The Careers accordion was not changed.

Dark mode: the FAQ was checked by colour readings and is readable at desktop and phone widths.

5. Blog, case study and portfolio status

Area	Status
Blog listing and cards	All 11 different and realistic; card layout unchanged
Published article pages	11 of 11 updated, alt text added, text and dates unchanged
Case studies	3 of 3 updated and labelled
Portfolio	13 of 13 updated, labelled; gallery layout and hover kept
Drafts	**Not changed:** all 20 keep their older images, as the brief covered published pages

6. WebP results

- 74 new WebP files, 3.3 MB in total, largest 112 KB, at quality 84 using GD. Each file's format and width were checked after saving.
- Responsive copies: articles and case studies at 1200, 800 and 420 wide; portfolio at 1212 and 606; Where We Work at 960 and 480.
- The upload pipeline is unchanged and passes 77 of 77 tests.
- No files were deleted. Older images remain on disk.
- PNG originals: `backups/generated-content-photos-originals-2026-11-06/`.

7. Homepage comparison

Compared with a baseline taken just before this work: 16 captures, 8 widths in light and dark.

Check	Result
Section heights	Only Where We Work changed; sections below it move down accordingly
Images	Only Insights and Where We Work changed
Text	Only Where We Work, plus the hero counter caught mid-animation (7+ against 8+)
Fonts and colours sampled	No changes
Sideways scrolling, script errors, failed requests	None

This compared measurements and image paths, not pixel-by-pixel images. The hero, sliders, header and footer were not edited.

8. Test results

Tests that write data ran only on an isolated copy. The real site received read-only requests and migration 007.

Suite	Where	Result
Fresh install through migration 007	Isolated	Passed; second run changes nothing
Public	Isolated	107 passed, 0 failed
Admin	Isolated	291 passed, 0 failed
SEO and delete	Isolated	181 passed, 0 failed
Browser	Isolated	54 passed, 0 failed
Uploads	Isolated	77 passed, 0 failed
Content and images	Isolated and real	804 passed, 0 failed on each
Mega menu	Isolated	234 passed, 0 failed
Mega menu	Real	**233 passed, 1 failed**
Read-only crawl	Real	139 passed, 0 failed
Admin panel click test	Real	10 passed, 0 failed
Heading styles	Isolated	1,362 compared, 0 differences

The one failure: the touch test tapped Services while the page's loading screen was still showing, on a first load, so the tap didn't reach the menu. I repeated the check on 4 pages: the same tap failed once, immediately on a first load, and worked all 12 times after the loading screen cleared. This comes from the existing loading screen, not this work. Visitors can't tap anything until it clears.

Responsive check: 12 pages (blog, blog page 2, an article, case studies, a case study, portfolio, a portfolio item, products, about, contact, careers, areas) at 320, 375, 425, 768, 1024, 1280, 1440 and 1920. No broken images, stretched images, sideways scrolling, failed requests or script errors, and one H1 each.

Real data: admin password hash, SMTP settings and `.env` are unchanged (checksums compared), with 0 enquiries, 0 applications and 3 uploads, as before. No PHP errors were logged on the real site during this work. Nothing was committed to Git.

Backups: `backups/before-final-visual-2026-11-06/` holds the code archive (102 MB, listed in full without errors) and two database dumps (28 tables each). They have not been test-restored.

Not tested: sharing images on real social platforms, Rich Results Test and Search Console (these need a public URL), and hover on every portfolio item individually.

9. Performance

Lighthouse, mobile, local server, two runs each:

Page	Performance	LCP	CLS	Weight
Home	30, 46	12.5 s, 12.4 s	0.046	8.2 MB
Blog	59, 61	14.5 s, 14.4 s	0.03	2.75 MB
Article	60, 60	13.6 s, 13.4 s	0	2.5 MB
Portfolio	60, 60	14.7 s, 15.0 s	0	3.24 MB
Case study	60, 60	13.2 s, 13.1 s	0	2.48 MB

Slow loading is still a real problem. LCP is far above Google's 2.5 s target and has not improved. Home scored 53 three rounds ago and swings widely between runs, so I can't rule out a slowdown. Compression is off locally, so re-measure on production.

10. Remaining issues

Priority	Issue	Action
High	External plagiarism check not run; no score exists	Run an external checker

Priority	Issue	Action
High	Slow mobile loading (LCP 12–15 s)	Enable compression, re-measure on production
High	Work With Us shows fictional company logos, licence unconfirmed	Replace with real logos, or confirm the licence
High	Digital Marketing, Mobile, SEO and CRM experience unconfirmed	Confirm, or unpublish
Medium	AI-generated people could be mistaken for staff or clients	Don't present them as your team or customers
Medium	Older template images remain, and were not part of this work: Services listing cards (one shows a person beside an X logo), products, about page. `blog1-8.png` has a watermark and stays in the project	Confirm licences, or ask me to replace them
Medium	20 drafts still use older images	Give each one an image before publishing
Medium	Sample portfolio and case study content; six thin older posts	Replace with real work; expand
Medium	Gmail App Password was shared in chat	Rotate it
Low	Sharing images are WebP, which some platforms may not show	Check after launch
